

## Ichneumonidae (Hymenoptera) new to Finland. IV

Reijo Jussila

Jussila, R. 1996: Ichneumonidae (Hymenoptera) new to Finland. IV. — Entomol. Fennica 7: 95–98.

Five ichneumonids new to Finland are reported: *Syrphoctonus megaspis* (Thomson), *Woldstedtius holarcticus* (Diller), *Diplazon pallicoxa* Manykian, *Chorinaeus flavipes* Bridgman and *Trieces dinianae* Aeschlieman.

### Diplazontinae

*Syrphoctonus megaspis* (Thomson, 1890)

*Homoporus megaspis* Thomson 1890: 1516, ♀.

*Homocidus megaspis* (Thomson). Morley 1914: 130, ♀.

*Diplazon megaspis* (Thomson). Beirne 1941: 693, ♂♀.

*Homotropus megaspis* (Thomson). Dasch 1964: 100.

*Syrphoctonus megaspis* (Thomson). Fitton 1982: 42.

Four females have been found as a new species to the Finnish fauna: *Al*: Finström, Husö 670:10 9.IX.1978 (mixed lamp, R. Jussila leg.), *Ab*: Kaarina, Kuusisto 675: 23 9.IX.1980 (luxuriant growth grass, R. Jussila leg.), Mynämäki, Pahnassuo of Kalela 675:23 9.IX.1978 (pine bog, R. Jussila leg.), and *St*: Pori, Reposaari 684:20 28.VII.1969 (mixed lamp, V. Lauro leg.). The species has earlier been found in Germany (Schmiedeknecht 1926) and Ireland (Beirne 1941).

Among the Finnish *Syrphoctonus* species *megaspis* most closely resembles *S. pictus* (Gravenhorst, 1829) but it is larger (6–7 mm long, length of *pictus* is 4–6 mm) and it has more profuse pale markings (e.g. the scutellum has pale margins at the sides and apex, and the large facial path meets the yellow clypeus). For more details, see Beirne (1941).

*Woldstedtius holarcticus* (Diller, 1969)

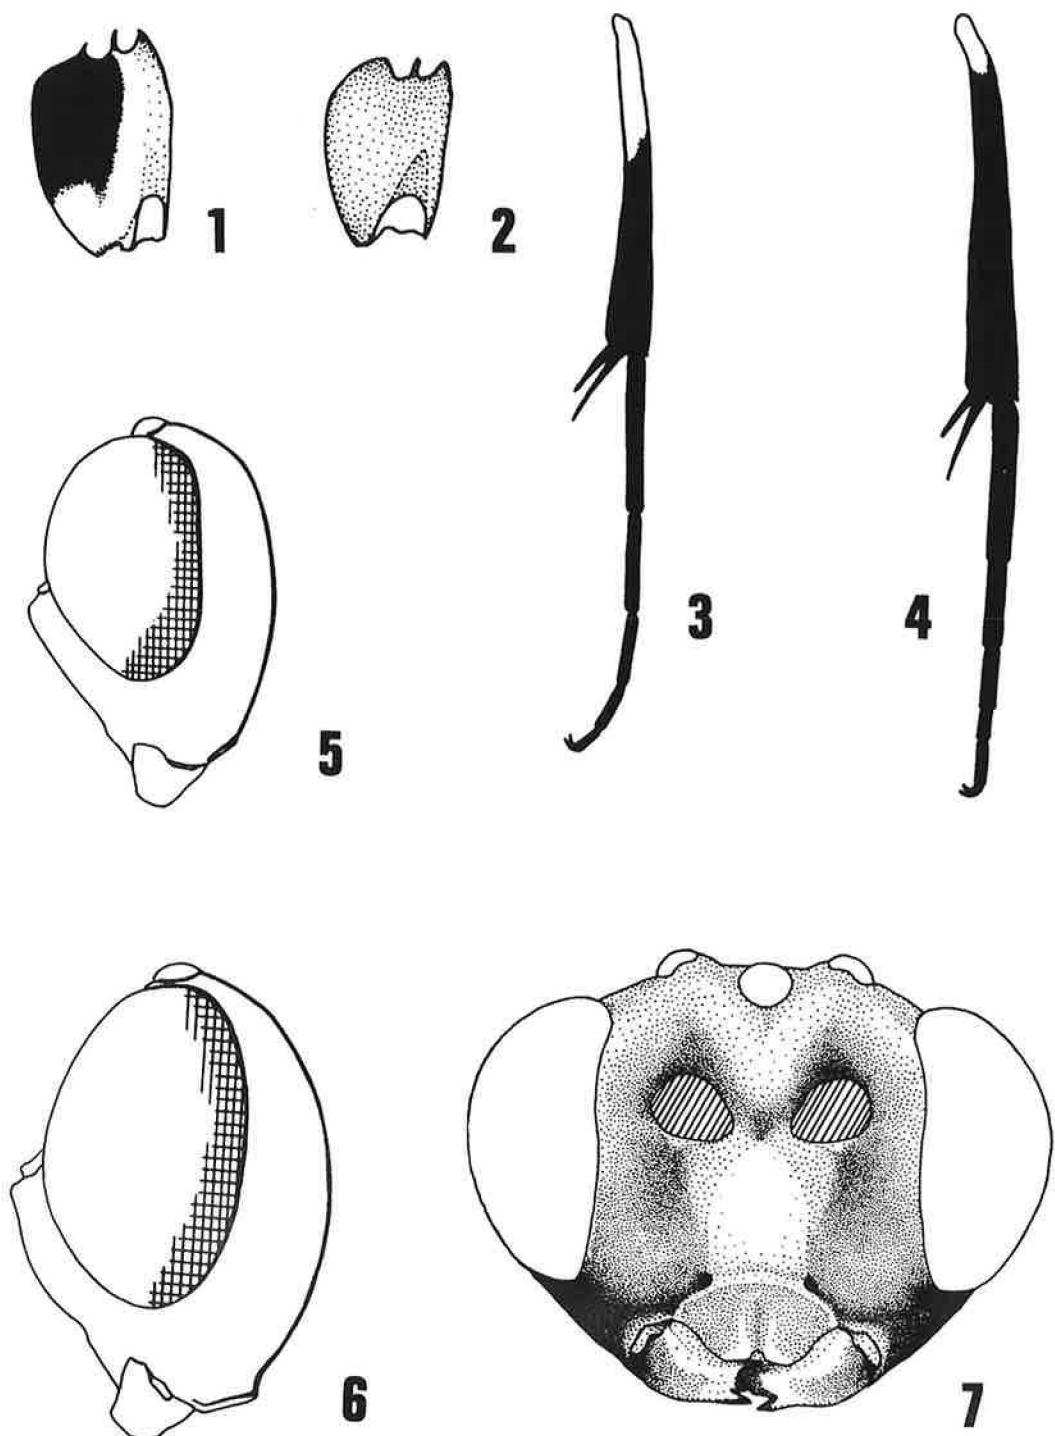

*Syrphoctonus holarcticus* Diller 1969: 546, ♀.

*Woldstedtius holarcticus* (Diller). Kasparyan 1981: 506.

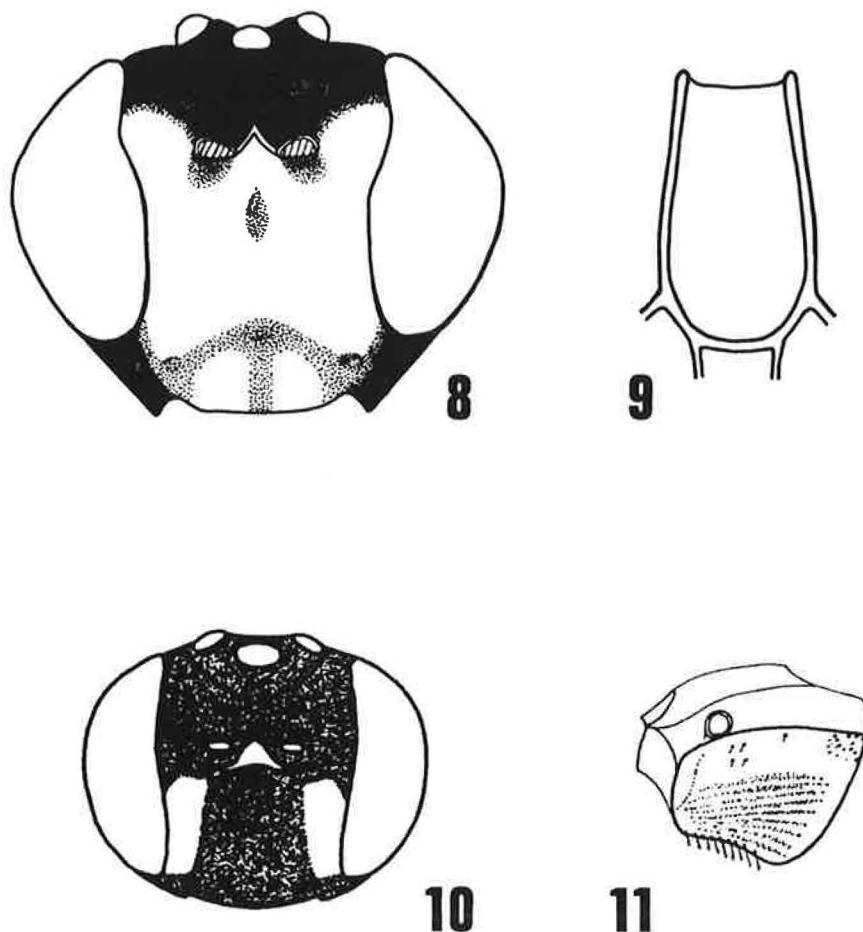

1 ♀ has been found in *Al*: Finström, Husö 670:10 4.VIII.1978 (mixed lamp, R. Jussila leg.), 1 ♀ *Ab*: Houtskari, Hyppeis 669:19 VII.1988 (mixed lamp, H. Bruun leg.), 1 ♀ Sauvo, Karinkorva of Karuna 669:25 21.VII.1966 in a meadow (R. Jussila leg.), 2 ♀♀ *Ka*: Virolahti 672:53 21.VII. 1975 (mixed lamp, R. Jussila leg.), 1 ♀ *St*: Pori, Reposaari 684:20 4.VIII.1969 (mixed lamp, V. Lauro leg.), *EH*: Lempäälä, Mäyhäniemi 680:32 1968 (mixed lamp, O. Sotavalta leg.), and 1 ♀ *Oa*: Ilmajoki 697:27 22.VII.1988 (V.-M. Mukkala, leg.).

This species, new to the fauna of Finland, has previously been found in Central Europe, Russia, India and North America (Diller 1969 and 1980, Kasparyan 1981).

*Woldstedtius holarcticus* resembles most of all *W. flavolineatus* (Gravenhorst, 1829) but its middle and hind coxae are black with lemon yellow apex and often with a lemon yellow longitudinal streak (Fig. 1), and its hind coxae are black. The hind tibiae of *holarcticus* are proximally far yellow, and the hind tibiae and tarsi thin (Fig. 3). The head of *holarcticus* is broad and only a little high, and the face rather flat (Fig. 5). In *flavolineatus* the middle and hind coxae are reddish (Fig. 2), the hind tibiae only somewhat yellow basal, its hind tibiae and tarsi are thicker, its head is not so broad (Fig. 4) and its face is a little raised. (Fig. 6). The face of *S. holarcticus* has been scored in Fig. 7. For more details, see Diller (1969).

Figs. 1, 3, 5 and 7. *Woldstedtius holarcticus* (Diller), and Figs. 2, 4 and 6. *Woldstedtius flavolineatus* (Gravenhorst). — 1. and 2. middle coxa; 3 and 4. hind tibia and tarsi; 5. and 6. head, in sinistral view; 7. face, in front view.

Figs. 8–9. *Chorinaeus flavipes* Bridgman. — 8. face, in front view; 9. fused areola and basal areola of propodeum, in dorsal view. Figs. 10–11. *Trieces dinianae* Aeschlieman. — 10. face, in front view; 11. propodeum, in sinistral view.

*Diplazon pallicoxa* Manukyan, 1987

*Diplazon pallicoxa* Manukyan 1987: 70, ♂.

One female has been found in Ab: Sauvo, Karinkorva of Karuna 669:25 11.VIII.1985 from vegetation by the side of a road (R. Jussila leg.). This species, new to Finland, has previously been found at least in Russia (e.g. from St. Petersburg) and Armenia (Manukyan 1987).

The best identification marks of *Diplazon pallicoxa* are its yellowish hind coxae, weak carinae of the propodeum and apical missing carinae of the 1st tergite. Orbital streaks in *pallicoxa* are broad reaching as far as the mandibles and widening downward, the face is weakly chagrined and the anten-

nae have relatively long hairs. For more details, see Manukyan (1987).

#### Metopiinae

*Chorinaeus flavipes* Bridgman, 1881

*Chorinaeus flavipes* Bridgman, 1881: 165; Kusigemati 1969 and 1971, ♂.

One male specimen has been found in Ab: Turku, Paattinen 672:24 15.VI.1985 in grass (Jarkko Jussila leg.). The species is new to the Finnish fauna and it is the first find of the male sex in Europe. It has earlier been found in Sweden, Great Britain

(Aeschlieman 1975) and Japan (Kusigemati 1971).

This species is easily recognisable by its yellowish front and middle legs and hind tibiae. Its malar space is longer than the basal width of the mandible (Fig. 8), the mandible is about 1.6 times as long as the basal width, the fused areola and basal areola of the propodeum is rather parallel-sided (Fig. 9), and the tarsal claws are pectinate. For more details of *Ch. flavipes*, see Aeschlieman 1979 and of the male, see Kusigemati (1967).

### *Trieces dinianae* Aeschlieman, 1973

*Trieces dinianae* Aeschlieman 1973: 982, ♂.

1 ♂ has been found in *Sb*: Varpaisjärvi 702:54 16.VI.1988 and 3 ♀♀ in *Kn*: Kuhmo, Ulvinsalo 710:66 8.VII.1980. All specimens were collected from pine bogs (R. Jussila leg). This species has earlier been found in French and the Altai mountains (Tolkanitz 1981).

*Trieces dinianae* is easily recognisable by the colouring of the face (Fig. 10) and the extremely wide stigma of the propodeum (Fig. 11). For more details, see Aeschlieman (1973).
