

Contribution to the fauna of Elachistidae (Lepidoptera) of the Southern Ural Mountains

Lauri Kaila, Kari Nupponen, Jari Junnilainen, Timo Nupponen, Jari-Pekka Kaitila & Vladimir Olschwang

Kaila, L., Nupponen, K., Junnilainen, J., Nupponen, T., Kaitila, J.-P. & Olschwang, V. 2003: Contribution to the fauna of Elachistidae (Lepidoptera) of the Southern Ural Mountains. — Entomol. Fennica 14: 65–90.

The Elachistidae fauna of the southern Ural area, Russia, is outlined. A total of 51 species are listed, four of which remain unidentified to species level. Six species are described as new: *Elachista (Aphelosetia) olschwangi* Kaila sp. n., *E. (A.) arduella* Kaila sp. n., *E. (A.) gibbera* Kaila sp. n., *E. (A.) chamaea* Kaila sp. n., *E. (A.) acutella* Kaila sp. n. and *E. (Elachista) devexella* Kaila sp. n. Four species are reported for the first time from Europe and illustrated: *Perittia sibirica* Sinev, *Elachista (Hemiprosopa) altaica* (Sinev), *E. (E.) megagnathos* Sruoga and *E. (E.) baikalica* Kaila. The previously unknown female of *E. megagnathos* is described. Fourteen species are reported as new to Russia. Further illustrations and notes on some poorly known species are given.

1. Introduction

The Ural Mountains form a 2000 km long natural border between Europe and Asia. The mountains almost reach the Caspian Sea in the south and the Arctic Ocean shore in the north. It is over 300 million years old (Olenev 1965) and a relatively low mountain range, the highest elevation in the southern part being 1640 m (a.s.l.). The biotopes

at higher elevation are taiga forests with a few isolated mountain tundra habitats on the highest hilltops. In the region north of 55°N there are forest steppes, mixed forests and frequently small lakes, bogs and various kinds of wet meadows. The southeastern and southernmost parts of the Ural Mountains have been reduced to a foothill zone, gradually becoming lowland steppe without any clear border. In this region there exist sev-

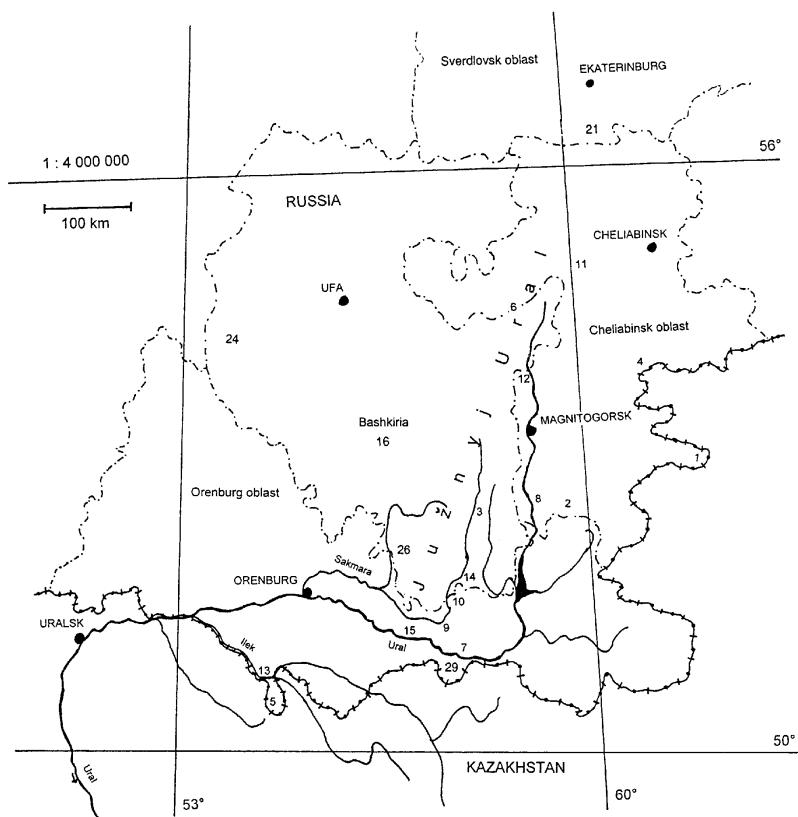

Fig. 1. Map of the study area. Numbers refer to the collecting sites of the material.

eral rather large affluents of the river Ural (Utva, Ilek, Hobda, Kumak, Suundyk, Tamlyk, Sakmara, Salmych) increasing the diversity of nature. The lowland steppe belt continues up to Central Asia in the east. The western side of the southern Urals is mainly agricultural area with numerous oil wells as a distinctive mark.

The lepidopterology has a long history in the Southern Urals region, thanks to the work of Prof. E. Eversmann (1794–1860). In his works he outlined the Lepidoptera of the Volga-southern Ural area, and included records of a large number of larger Microlepidoptera as well. However, only a few representatives of the smaller sized moths, representatives of Elachistidae among them, were mentioned by him. The sole species of Elachistidae mentioned by him is *Elachista galacticella* (Eversmann) (as *Oecophora galacticella*) (Eversmann 1844). Later on, very little information has been published on the Elachistidae fauna of the region. These records include two further species only, *Elachista fasciola* Parenti by Sachkov (1995) and *E. manni* Traugott-Olsen by Traugott-Olsen (1990a).

The recent collecting trips made by Finnish amateur entomologists have yielded a lot of new records from this area, including several species new to Europe and at least six undescribed species. To support the EU's Fauna Europaea programme aiming at mapping the distribution of all European animals, we here publish these records and earlier published records known to us. To our knowledge the earlier records of the area include no more than three species. In this paper we record the occurrence of 51 species of Elachistidae in the study area, including six species described here as new to science, and an additional four species reported for the first time from Europe. It should be noted that if the Ural River was used as the 'definite' border of Europe, some of the collecting sites would fall beyond the limits of Europe. However, it would not be sensible to divide southern Ural into two pieces in such a violent way, because the river Ural with its affluents widely meanders on both sides of the main flow forming a biogeographically compact region at the southern end of the Ural Mountains.

2. The investigated area, material and methods

The investigated area is situated in Sverdlovsk, Cheliabinsk and Orenburg oblasts and Bashkiria in the southern Ural Mountains, between 50°40'N–56°30'N and 53°05'E–62°06'E. A few records from the lower Volga region are included in the list. The majority of collecting sites were located on the eastern–southern foothill region at low altitude. The habitats were mainly different kinds of steppes, but also taiga forests, alpine meadows and mountain tundra. The lowest locality was in the valley of the river Ilek, Novoiletzk (100 m a.s.l.) and the highest one the Iremel Mountain (1580 m a.s.l.). Most localities were lying at an elevation of 200–450 m.

The present article is based on the material collected during 1996–2001 on 9 different expeditions. The dates, areas visited and collectors on each of the trips are as follows:

- 1: 13.–29.VI.1996; Cheliabinsk oblast, Bashkiria; K. Nupponen, J.-P. Kaitila, J. Junnilainen, M. Ahola.
- 2: 26.VI.–16.VII.1997; Cheliabinsk oblast; K. Nupponen, J.-P. Kaitila, J. Junnilainen, M. Ahola.
- 3: 25.V.–22.VI.1998; Orenburg oblast, Cheliabinsk oblast, Bashkiria; K. Nupponen, T. Nupponen, J. Junnilainen.
- 4: 11.–31.VII.1998; Orenburg oblast, Cheliabinsk oblast, Bashkiria; K. Nupponen.
- 5: 11.–20.V.1999; Orenburg oblast, Cheliabinsk oblast; K. Nupponen.
- 6: 13.–30.VI.1999; Orenburg oblast, Cheliabinsk oblast, Bashkiria; K. Nupponen, T. Nupponen.
- 7: 25.VII.–04.VIII.2000; Orenburg oblast, Cheliabinsk oblast, Bashkiria; T. Nupponen.
- 8: 29.–31.V.2001, 09.–28.VI.2001; Orenburg oblast, Cheliabinsk oblast, Bashkiria, Sverdlovsk oblast; K. Nupponen.
- 9: 12.–17.VI.2001; Orenburg oblast, Orenburgskii Natl. Pk., Burtinskij Steppe; J. Kullberg, M. Zalewski.

The material, comprising over 700 pinned specimens of Elachistidae, was collected both by artificial light at night and by sweeping and netting during daytime, especially at dusk. Identifications were made by Lauri Kaila. The collected material is generally deposited in the collections of the observers and the Finnish Museum of Natural History, University of Helsinki (ZMH).

3. Collecting sites

The collecting sites are briefly described below. Abbreviated variants of locality names are given in uppercase letters before each locality and used later in the species list. The italicised dates indicate daytime collecting only in the locality. The

number given to each of the localities is connected with that on the map (Fig. 1). Colour photographs of some of the collecting sites are published by Nupponen & Fibiger (2002).

- 1, AJAT RIVER: Cheliabinsk oblast, 53°02'N 62°06'E, 200 m, Ajat river near Nikolaevka village. A rocky hill in a riverbank, surrounded by a moist place on a riverside and a large *Artemisia* steppe. 03.–05.VII.1997, 24.–25.VII.1998, 04.–05.IX.2000.
- 2, ARKAIM: Cheliabinsk oblast, 52°39'N 59°34'E, 350 m, Arkaim reserve near Amurskii village. A large reserve with different kinds of steppe habitats. 14.–19.VI.1996, 06.–10.VII.1997, 22.–23.VII.1998, 17.V.1999, 15.–16.VI.1999.
- 3, BAJMAK: Bashkiria, 52°40'N 58°34'E, 450 m, Bajmak 15 km E. Open foothill steppe locality. 17.–18.VI.1998.
- 4, BERLIN: Cheliabinsk oblast, 53°59'N 61°12'E, 250 m, Troizkii reserve near Berlin village. A small, mainly grassland steppe surrounded by a bog and young forest. 30.VI.–02.VII.1997.
- 5, CHALK HILLS: Orenburg oblast, 50°40–45'N 54°26–28'E, 170–230 m, Pokrovka village 20 km S, Schibendy valley. A dry, open, lowland *Artemisia* steppe with wet meadows along the small riverside. Whitish limestone rocks surround the flat valley, the vegetation being luxuriant on northern slopes and very sparse but characteristic (e.g. *Nanophyton erinaceum* and *Anabasis cretacea*) on southern slopes. 03.–07.VI.1998, 17.–18.VII.1998, 21.–24.VI.1999, 31.VII.–01.VIII.2000, 30.–31.VIII.2000, 10.–11.VI.2001.
- 6, EKATERINBURG: Sverdlovsk oblast, Ekaterinburg city. 27.–28.VII.1998, 25.–28.VI.2001.
- 7, EKATERINBURG BIOL.ST.: Sverdlovsk oblast, Ekaterinburg 50 km S, near Dvurechensk village, biological station of Ural's university. Mixed forests, bogs and meadows. 20.–22.VI.1998.
- 8, IREMEL: Cheliabinsk oblast, 54°31–35'N 58°49–54'E, 900–1580 m, Iremel Mountain reserve. Taiga forest between 800–1300 m, alpine meadows at 1300–1400 m and mountain tundra at the highest elevation over 1400 m. 23.–27.VI.1996, 11.–14.VII.1997, 25.–28.VI.1999, 16.–17.VI.2001.

Fig. 2. *Perittia sibirica* Sinev, habitus of ♂ (Miass 13.VI.1996).

Fig. 3. *Perittia sibirica* Sinev, habitus of ♀ (Kuvandyk 21.VII.1998).

- 24, KANDRYKUL: Bashkiria, $54^{\circ}28'N$ $54^{\circ}05'E$, 200–250 m, lake Kandrykul. Young forests and different kinds of meadows. 30.–31.V.2001.
- 7, KIDRIASOVO: Orenburg oblast, $51^{\circ}13'N$ $57^{\circ}37'E$, 350 m, Mednogorsk 20 km S, near Kidriasovo village. Open, partly gravelly foothill steppe with plenty of *Caragana* bushes in lower parts of the slopes and wet meadows between the hills. 28.–30.V.1998, 16.VI.1999.
- 8, KIZILSKOYE: Cheliabinsk oblast, $52^{\circ}39'N$ $59^{\circ}00'E$, 300 m, Kizilskoye 15 km S, near Ural river. Dry, open *Artemisia*–*Stipa* steppe with rocky hills. 27.–28.V.1998, 18.V.1999, 26.VII.2000, 03.IX.2000.
- 9, KUVANDYK: Orenburg oblast, $51^{\circ}26'N$ $57^{\circ}26'E$, 250 m, Kuvandyk 12 km SE. A foothill region with different kinds of steppes and old *Quercus*–*Populus*–*Betula* forests on the top of the hills. 13.–16.VI.1998, 19.–21.VII.1998, 15.V.1998, 02.VIII.2000, 02.IX.2000.
- 10, KUVANDYK II: Orenburg oblast, $51^{\circ}37'N$ $57^{\circ}34'E$, 300 m, Kuvandyk 30 km NE. Rocky hills and meadows, at the slopes some blackish coloured, hot, gravelly spots with sparse vegetation. 16.–17.VI.1998, 03.VIII.2000.
- 11, MIASS: Cheliabinsk oblast, $55^{\circ}01'N$ $60^{\circ}06'E$, 350 m, Miass, Ilmen State reserve. Forest steppes and old conifer forests. The records from Miasovo lake belonging to the same reserve (appr. 10 km NE) are included in Miass. 13.VI.1996, 28.–29.VI.1996, 26.–29.VI.1997, 15.–16.VII.1997, 25.–26.V.1998, 19.–20.VI.1998, 11.V.1999, 18.–20.V.1999, 29.–30.VI.1999, 26.VIII.2000, 06.IX.2000,
- 29.–30.V.2001, 18.–21.VI.2001, 24.VI.2001; In addition, light trap collecting during 15.VI.–24.VIII.1999, 25.VII.–05.IX.2000, 29.V.–24.VI.2001.
- 12, MOSKOVO: Cheliabinsk oblast, $53^{\circ}57'N$ $59^{\circ}03'E$, 650 m, near Moskovo village. Open, rocky foothill region with different kinds of steppes and wet meadows along the riverside. 22.–23.VI.1996, 10.–11.VII.1997, 26.V.1998, 18.VI.1998, 11.–13.VII.1998, 04.VIII.2000, 26.VIII.2000.
- 13, NOVOILETZK: Orenburg oblast, $50^{\circ}59'N$ $54^{\circ}17'–22'E$, 100 m, Novoiletzk 8 km E, Ilek river valley. Sand dune region with few *Artemisia* steppe spots, wet meadows and wetlands. 08.–09.VI.1998.
- 14, SAKMARA RIVER: Bashkiria, $51^{\circ}54'N$ $57^{\circ}43'E$, 450 m, Sakmara river near Jantyshovo village. Rocky slopes, forest steppes, meadows and mixed forests. 20.–21.VI.1996.
- 26, SULEIMANOVO: Bashkiria, $52^{\circ}12'N$ $56^{\circ}50'E$, 400–500 m, near Suleimanovo village. Rocky slopes, forest steppes, meadows and mixed forests. 14.–15.VI.2001.
- 15, VERBLJUSHKA: Orenburg oblast, $51^{\circ}23'N$ $56^{\circ}49'E$, 130–340 m, Donskoje village 6 km W, Mount Verbljushka. A 200 m high hill in the Ural River bank at the southern corner of the foothill region. The southern slope is extremely hot with more or less sparse vegetation. *Artemisia* steppe is present on the western slope and there is a quite luxuriant, rich flora on the northern slope. There are wet meadows and deciduous forest between the hill and the river banks. 30.V.–02.VI.1998, 10.–12.VI.1998, 14.–16.VII.1998, 12.–

- 14.V.1999, 17.–19.VI.1999, 27.–29.VII.2000,
27.–28.VIII.2000.
— 16, ZIRGAN: Bashkiria, 53°12'N 56°00'E,
400 m, near Zirgan village. Forest steppes.
24.VI.1999.
— 17: Orenburg oblast, Orenburgskii Natl. Pk.,
Burtinskij Steppe. Open steppe habitats
ranging from wet *Phragmites* stands to dry
steppes with low vegetation. 12.–17.VI.2001.

4. List of species

The generic and subgeneric classification follows Kaila (1999a). The sequence of species of *Elachista* is based on grouping to species groups and complexes following the works of Traugott-Olsen & Schmidt Nielsen (1977), Traugott-Olsen (1988), Traugott-Olsen (1990a), Kaila (1996), Kaila (1997), Kaila (1999b), Kaila & Junnilainen (2002) and unpublished data of L. Kaila. The terminology follows Traugott-Olsen & Schmidt Nielsen (1977) and Kaila (1999a). The dates and localities of records for each species are given, as well as further notes on some poorly known species.

Perittia herrichiella (Herrich-Schäffer, 1855)

Miass 27.VI.1997 1 ♂ K. Nupponen & J. Junnilainen leg.

Distribution. Widespread in Europe. Recorded also in Canada where it occurs probably due to an

Fig. 5. *Elachista altaica* (Sinev), habitus of ♂ (Novoiletzk 8.VI.1998).

unintentional introduction (Kaila 1995). New to Russia.

Perittia sibirica Sinev, 1992 (Figs. 2–4)

Verbljushka 31.V.–2.VI.1998 3 ♂ 3 ♀ J. Junnilainen leg., 1 ♂ 3 ♀ T. & K. Nupponen leg.; Chalk Hills 17.VII.1998 1 ♀ K. Nupponen leg.; Kuvandyk 21.VII.1998 1 ♀ K. Nupponen leg.; Miass 13.VI.1996 1 ♂ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg. (last specimen in ZMH), 27.VI.1997 2 ♂ 1 ♀ J.-P. Kaitila leg.

Distribution. The original description of *Perittia sibirica* was based on four specimens reared from *Lonicera tatarica* L. from Irkutsk. No other records are known to us.

Remarks. New to Europe. The habitus of the male is illustrated in Fig. 2, that of the female in Fig. 3, and the male genitalia in Fig. 4.

Elachista (Hemiprosopa) altaica (Sinev, 1998) (Figs. 5 and 6)

Novoiletzk 8.VI.1998 3 ♂ J. Junnilainen leg., 9.VI.1998 3 ♂ T. & K. Nupponen leg.

Distribution. The original description of *E. altaica* (Sinev) was based on one specimen from Altai Mts. In addition, there are specimens collected from Russia: Tuva Rep.: Ust-Ujuk 1998 J. Jalava & J. Kullberg leg. (ZMH). No other records are known to us.

Remarks. New to Europe. The specimens were found at a saline wetland. The habitus of ♂ is illustrated in Fig. 5, and the male genitalia in Fig. 6.

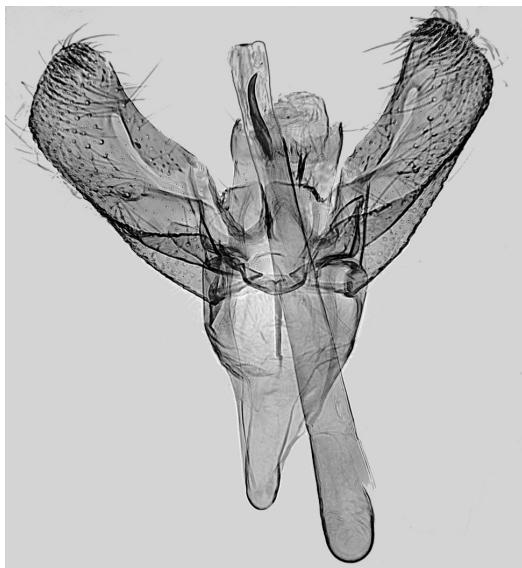

Fig. 6. *Elachista altaica* (Sinev), ♂ genitalia (Russia: Tuva rep. 52°04'N 94°22'E, 670 m, Ust-Ujuk 3.–5.VI.1995 Jalava & Kullberg leg., L. Kaila prep. n. 1762).

village 14.–19.VI.1996 4 ♂ 1 ♀; Cheliabinsk distr., 55°01'N 60°06'E, 350 m, Miass, Ilmen State Res. 28.VI.1996 2 ♂ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg., 19.VI.1998 1 ♂ T. & K. Nupponen leg.; Orenburg distr. 51°23'N 56°49'E, 130–340 m 6 km W Donskoje Village, Mt. Verbljushka 10.–12.VI.1998 10 ♂ 1 ♀ J. Junnilainen leg., 30.V.1998 3 ♂, 1. VI.1 ♂, 2.VI.1998 1 ♂, 10.VI.1998 2 ♂, 11.VI.1999 1 ♂ 1 ♀, 17.VI.1999 1 ♂ 1 ♀, 19.VI.1998 1 ♂ T. & K. Nupponen leg.; Bashkiria, 51°54'N 57°43'E, 450 m, Sakmara river, Jantyshevo village 21.VI.1996 28 ♂ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg.; Astrahan distr. nr. Bogdo village, Baskunzak salt lake 4.VI.2001 1 ♂ K. Nupponen leg.

Diagnosis. *Elachista olschwangi* sp. n. is similar to *E. pollinariella* Zeller, *E. dumosa* Parenti, *E. nevadensis* Parenti and especially *E. gormella* Nielsen & Traugott-Olsen (cf. Traugott-Olsen & Schmidt Nielsen (1977), Parenti (1978), Parenti (1981) and Nielsen & Traugott-Olsen (1987)). From *E. pollinariella* and *E. dumosa* it is readily separated by its smaller and deeply incised uncus lobes, and the female papillae anales that are not sclerotised in *E. olschwangi*, but are sclerotised and expanded in these two species. The shape of juxta lobes is quite different in *E. olschwangi* from *E. nevadensis* as being much longer and not laterally produced in *E. olschwangi*. From *E. gormella* *E. olschwangi* differs externally by its pale yellowish forewing colour, *E. gormella* being darker brownish; in the male genitalia as having broader valva and aedeagus than *E. gormella* and in the shape of juxta lobes which are medially distinctly convex in *E. olschwangi*, but nearly straight in *E.*

Elachista (Dibrachia) kalki Parenti, 1978

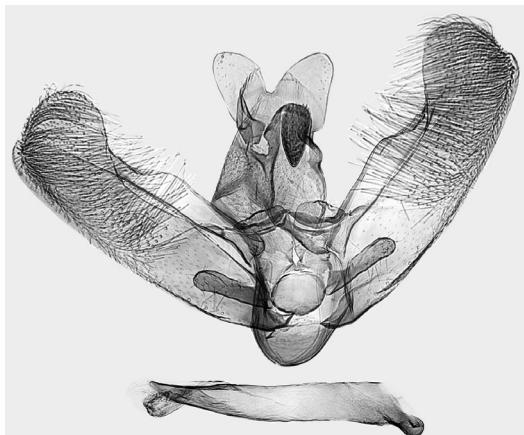

Kizilskoye 27.V.1998 6 ♂ J. Junnilainen leg., 30 ♂ T. & K. Nupponen leg.; Moskovo 26.V.1998 1 ♂ J. Junnilainen leg.; Kidriasovo 28.–29.V.1998 13 ♂ J. Junnilainen leg., 2 ♂ T. & K. Nupponen leg.; Verbljushka 13.V.1999 3 ♂ K. Nupponen leg.; Berlin 30.VI.1997 1 ♂ K. Nupponen & J. Junnilainen leg.

Distribution. Central and eastern Europe, Kazakhstan, Russia: Tuva Rep.

Elachista (Aphelosetia) olschwangi Kaila sp. n. (Figs. 7–10)

Holotype ♂: Russia, S. Ural, Cheliabinsk distr. 53°57'N 59°03'E, 650 m, near Moskovo village 22.VI.1996 K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg. L. Kaila prep. n. 3312 (in coll. ZMH).

Paratypes (67 ♂ 4 ♀): 10 ♂ with the same label data as in the holotype; Cheliabinsk distr. near Moskovo village 10.VII.1997 1 ♂ K. Nupponen & J. Junnilainen leg.; Cheliabinsk oblast, 52°39'N 59°34'E, 350 m, Arkaim reserve near Amurskii

Fig. 8. *Elachista olschwangi* sp. n. paratype ♀.Fig. 9. *Elachista olschwangi* sp. n. ♂ genitalia (holotype, L. Kaila prep. n. 3312).

gormella; in the female by the signum which is large, boomerang-shaped in *E. olschwangi*, smaller and nearly rounded in *E. gormella*. Externally *E. olschwangi* also resembles *E. subocellea* which occurs at the same area. *E. subocellea* however has strong orange transverse fasciae across forewing. Their male genitalia are readily separated by the broader valva and more rounded uncus of *E. olschwangi* as compared to *E. subocellea*. The vesica of *E. subocellea* contains a large horn-shaped cornutus that is lacking in *E. olschwangi*. The female genitalia of these species are easiest distinguished by the signum which is present as large and boomerang-shaped in *E. olschwangi*, but is absent in *E. subocellea*.

Description of ♂. Wing span 10–11.4 mm. Labial palpus 1.2 times the diameter of head, creamy white, second segment variably suffused with grey below. Head, neck tuft, tegula and tho-

Fig. 10. *Elachista olschwangi* sp. n. ♀ genitalia (paratype, L. Kaila prep. n. 3317).

rax creamy white. Scape of antenna suffused with grey, flagellum grey, annulated with somewhat paler rings. Foreleg dark grey, tibia and tarsal articles distally white; midleg leaden grey, tibia and tarsal articles distally white; hindleg inwardly ochreous, outwardly pale grey, tibia and tarsal articles distally ochreous white. Abdomen dorsally

shiny grey, segments distally paler, ventrally shiny pale grey. Forewing ground colour creamy white, sparsely scattered with raised dark grey tipped scales that sometimes form indistinct elongate patch between fold and dorsal margin in the middle of wing; across forewing four indistinctly delimited transverse ochreous brown fasciae: one at basal 1/5, one in the middle, one at distal 1/3, and one narrowly along termen; shorter fringe scales distally brown forming brown double fringe line; fringe scales brown except at apex creamy white. Underside of forewing dark grey, fringe scales ochreous, distally brown. Hindwing dark grey above with ochreous grey fringe scales, below costal half dark grey, dorsal half pale grey; fringe scales ochreous grey.

Female otherwise as male but flagellum of antenna thinner and more strongly annulated; forewing pale creamy white with very indistinct brownish transverse fasciae, and scattered with fewer raised brown-tipped scales.

Male genitalia: Uncus lobes slightly longer than wide, somewhat tapered towards broadly rounded apex, medially separated by deep indentation. Mesial knob of gnathos basally broad, three times longer than wide, basally nearly parallel-sided, distally tapered to pointed apex. Median plate of juxta rounded, evenly concave; juxta lobes longer than wide, mesial margin straight, joining distal margin without an angle; distal margin weakly convex, with a row of setae; lateral margin sclerotised, almost straight. Digitate process tongue-shaped, parallel-sided, distally blunt, length 1/2 of the length of valva. Valva broad; basal and distal fold of costa meet at half of the length of valva, costa medially convex; sacculus straight, meeting cucullus in a somewhat obtuse angle and with a small distal tooth; cucullus large, produced towards costa. Aedeagus 4/5 length of valva; broadest basally, gradually tapered towards pointed apex; basal opening dorsoposteriorly directed, caecum a blunt sac. Distal opening extended to 3/5 length of aedeagus; vesica with weakly sclerotised wrinkled sac and a group of minute spines.

Female genitalia: Papillae anales broad triangular, ventrally joined by Y-shaped sclerotisation. Apophyses posteriores straight, 1.5 times longer than the somewhat bent apophyses anteriores. Ostium bursae nearly rounded without sclerotised

reinforcements, antrum absent; colliculum short, ductus seminalis incepted anterior to it. Ductus bursae about three times longer than apophyses posteriores, membranous and without internal sclerotisations, anteriorly gradually broadened and laterally covered with minute granules; abruptly inserted to the oval-shaped corpus bursae. Median part of corpus bursae broadly covered with minute internal spines; signum as large as width of corpus bursae, dentate, medially widened to posterior direction.

Elachista (Aphelosetia) adscitella Stainton, 1851

Elachista revinctella auct., nec Zeller, 1850

Moskovo 10.VII.1997 1 ♂ K. Nupponen & J. Junnilainen leg.

Distribution. Transpalaearctic.

Remarks. *E. adscitella* was erroneously called *E. revinctella* Zeller in Traugott-Olsen & Schmidt Nielsen (1977), and subsequently in e.g. Falkovich (1990), Kaila (1992) and Sinev & Srugog (1997). The identity of these species was corrected by Parenti (1992).

Elachista (Aphelosetia) subalbidella Schläger, 1847

Arkaim 15.VI.1996 1 ♀ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg.; Iremel, 900–1300 m, 24.VI.1996 1 ♂ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg., 800 m, 25.VI.1999 3 ♂ 1 ♀ T. & K. Nupponen leg.

Distribution. Holarctic (Kaila 1997).

Elachista (Aphelosetia) obliquella Stainton, 1854

Elachista megerella auct. nec Hübner, 1810

Verbljushka 10.VI.1998 1 ♂ T. & K. Nupponen leg.

Distribution. Europe.

Remarks. New to Russia. The name *megerella* was considered to belong to Adelidae by Kozlov & Kaila (2002). Therefore the name *obliquella* Stainton, 1854 is now the oldest name available for this species.

***Elachista (Aphelosetia) cingillella* (Herrich-Schäffer, 1855)**

Verbljushka 12.VI.1998 1 ♀ T. & K. Nupponen leg.

Distribution. Central and northern Europe.

Remarks. The identity of this species has been largely misunderstood in the literature. For a review of this species complex, see Kaila & Junnilainen (2002).

leg., 2 ♂ J. Junnilainen leg.; Kizilskoye 27.V.1998 1 ♂ T. & K. Nupponen leg.; Kuvandyk II 16.VI.1998 1 ♂ T. & K. Nupponen leg.; Arkaim 15.VI.1996 1 ♂ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg.

Distribution. C. and S. Europe, Russia (Tuva Rep., unpublished material in ZMH). Seemingly Transpalaearctic in steppe regions.

Remarks. New to Russia.

***Elachista (Aphelosetia) fasciola* Parenti, 1983**

Arkaim 18.VI.1996 2 ♂ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg.; Miass 26.VI.1997 1 ♂, 27.-28.VI.1997 2 ♂ K. Nupponen & J. Junnilainen leg.; Iremel, 800 m, 25.VI.1999 1 ♂ T. & K. Nupponen leg.; Verbljushka 31.V.1998 3 ♂ 1 ♀, 2.VI.1998 4 ♂ 4 ♀, 12.VI.1998 1 ♂, 16.VII.1998 8 ♂ T. & K. Nupponen leg., 10.-12.VI.1998 1 ♂ 2 ♀ J. Junnilainen leg., 12.V.1999 1 ♂ K. Nupponen leg.; Kuvandyk 19.VII.1998 1 ♂ K. Nupponen leg.

Distribution. Transpalaearctic, from Eastern Europe to Urals, Russian Far East and Japan.

Remarks. The identification of this species is treated by Kaila & Junnilainen (2002). Many of the specimens were collected at afternoon.

Elachista (Aphelosetia) szocsi* Parenti, 1978Elachista manca* Falkovich, 1986

***Elachista (Aphelosetia) subocellea* (Stephens, 1834)**

Miass 28.VI.1996 1 ♂ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg., 26.–27.VI.1997 3 ♂ 1 ♀ J.-P. Kaitila leg., 26.VI.1997 2 ♂ 1 ♀ K. Nupponen & J. Junnilainen leg., 19.VI.2001 1 ♂, 24.VI.2001 1 ♀ K. Nupponen leg.

Distribution. Europe.

Remarks. *E. subocellea* belongs to the *E. collitella* complex as defined by Traugott-Olsen (1996). The taxonomy of this complex is unsettled, and in need of examination of good samples throughout the distribution ranges of the taxa involved. This is because both the male and the female genitalia of, e.g., *E. subocellea* display an exceptionally high level of variation in the structures of both male and female genitalia. The differences between specimens originating from one population can be so substantial that one would suspect the presence of more species unless a large series was examined showing the nature of the variation. There are, however, also seemingly constant differences between some populations suggesting that more than one species could indeed be involved in Europe. The specimens from S. Urals slightly differ from western and southern European specimens examined by us. As long as the possible significance of these minor differences is unknown we prefer considering the population of southern Urals to belong to *E. subocellea*. New to Russia.

***Elachista (Aphelosetia) bedellella* Sircom, 1848**

Arkaim 15.VI.1999 1 ♂ T. & K. Nupponen leg.; Chalk Hills 3.–6.VI.1998 5 ♂ 7 ♀ T. & K. Nupponen leg., 11.VI.2001 1 ♂ K. Nupponen leg.; Kidriiasovo 28.–29.V.1998 2 ♂ 2 ♀ J. Junnilainen leg.; Kuvandyk 14.VI.1998 1 ♂ 1 ♀ T. & K. Nupponen leg.; Orenburg distr. Orenburgskij Nat. Pk. 12.–17.VI.2001 1 ♂ J. Kullberg & M. Zalewski leg.; Suleimanovo 14.VI.2001 1 ♂ 2 ♀ K. Nupponen leg.; Verbljushka 10.VI.1998 2 ♂ 2 ♀ T. & K. Nupponen leg.

Distribution. The distribution of *E. bedellella* is somewhat unclear due to confusion with *E. lugdunensis* Frey (= *E. coeneni* Traugott-Olsen). These species, if distinct, seem to be best characterised by their forewing pattern. The forewings

of *E. bedellella* are brownish grey with distinctive white transverse fascia, costal and tornal spots, while those of *E. lugdunensis* are blurred whitish or pale greyish-brownish grey with indistinct pattern. The taxonomic status of the populations externally resembling *E. lugdunensis* outside Europe is unclear. The ‘typical’ *E. bedellella* is distributed to central and southern Europe.

Remarks. New to Russia.

***Elachista (Aphelosetia) pullicomella* Zeller, 1839**

Fig. 16. *Elachista gibbera* sp. n. holotype ♂.

Kaila prep. n. 3633), 5.VI.1998 2 ♀ (1 ♀ dissected, L. Kaila prep. n. 3630), 6.VI.1998 1 ♀, 23.VI.1999 (L. Kaila prep. n. 3634) 1 ♀ T. & K. Nupponen leg.

Diagnosis. *Elachista arduella* sp. n. belongs to those species in the sg. *Aphelosetia* that have a broad and shallow dorsally directed median sac in the median plate of juxta. Its very small-sized juxta and digitate process indicate a close relationship with *E. atrisquamosa* Staudinger and *E. ohridella* Parenti. Externally *E. arduella* differs from *E. atrisquamosa* by its paler and strongly mottled wing pattern and by its thicker antennae. The male genitalia of these species differ by the shape of the juxta lobes which are medially more expanded in *E. arduella* than in *E. atrisquamosa* (cf. Schmidt Nielsen & Traugott-Olsen (1978)). The aedeagus of *E. atrisquamosa* is narrower and gradually tapered towards apex while that of *E. arduella* is broadest near apex. *E. ohridella* is white with faint yellowish maculation in the forewings, and the male genitalia differ by the shape of the aedeagus being distally broader in *E. arduella* than in *E. ohridella* (cf. Parenti (2002)).

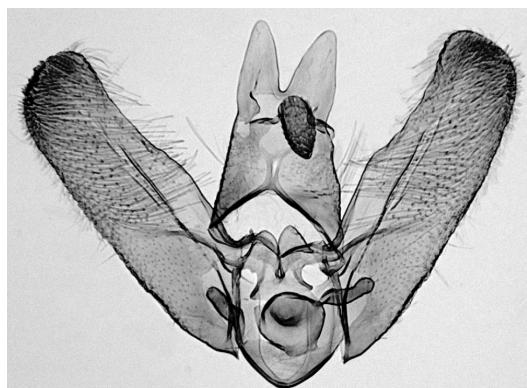

Description of ♂. Wing span 7.6 mm. Labial palpus 0.9 times the diameter of head, greyish white, below dusted with leaden grey scales especially at third segment. Sides of head narrowly creamy white, head otherwise leaden grey, mixed with paler scales; neck tuft greyish white. Tegula medially shiny grey, otherwise creamy white; thorax creamy white. Scape of antenna shiny grey, flagellum thick, dark grey, articles annulated with distinctive pale rings. Fore- and midleg outwardly shiny grey, inwardly pale grey, tibia and tarsal articles distally pale grey; hindleg unicolorous greyish white. Forewing ground colour creamy

Fig. 17. *Elachista gibbera* sp. n. paratype ♀.

white, with the following irregular patches formed of brownish grey tipped scales: broadly along basal third, and from middle to distal 5/6 of costal margin; between fold and dorsal margin one oblique patch at basal third and another just beyond middle of wing length; an oblique dark grey stripe from apex to tornus. Shorter fringe scales distally dark brownish grey forming a fringe line; fringe creamy white except at tornus grey. Underside dark grey; fringe creamy white except at tornus grey. Hindwing translucent, pale bluish grey, fringe pale ochreous grey; underside as above.

Female otherwise as male, but flagellum of antenna thinner; forewing silky white, indistinctly irrorated with ochreous yellow, with an indistinctly delimited brownish grey patch at distal 2/3 length of wing margin, and another elongate, often darker patch along outer margin.

Male genitalia: Uncus lobes triangular, 1.5 times longer than wide, tapered to narrowly rounded apex, separated by V-shaped incision. Mesial knob of gnathos basally narrow, oval-shaped and distally pointed. Juxta small; median plate with shallow posteriorly directed median sac; juxta lobes widely separated from each other, medially produced, median margin somewhat convex joining distal margin without an angle; distal margin with a few setae, straight; lateral margin concave. Digitate process short, setose, blunt, basally very narrow. Valva broad; basal and distal fold of costa meet at half of the length of valva, costa medially weakly convex; sacculus straight, meeting cucullus without an angle; distal margin of cucullus straight. Aedeagus half the length of valva, medially narrowest, with short caecum; distally bent with an obtuse angle; distal opening with two folded lobes, extended to 3/5 length of aedeagus; cornuti absent.

Fig. 18. *Elachista gibbera* sp. n. ♂ genitalia excluding aedeagus (holotype, L. Kaila prep. n. 3626).

Female genitalia: Papillae anales broad triangular, ventrally joined by Y-shaped sclerotisation. Apophyses posteriores stout, twice longer than the nearly straight apophyses anteriores. Ostium bursae situated at sternum 8; width of ostium bursae 1/3 of the distance between apophyses anteriores, forming narrow antrum, and abruptly narrowed to very short colliculum; ductus seminalis incepted anterior to colliculum. Ductus bursae about three times longer than apophyses posteriores, membranous and without internal sclerotisations or granules; inserted to oval-shaped corpus bursae without distinct limit. Corpus bursae medially broadly but sparsely covered by blunt spines. Signum formed as rounded group of coarse spines in anterior half of corpus bursae.

Elachista (Aphelosetia) gibbera Kaila sp. n. (Figs. 16–20)

Holotype ♂: Russia, S. Ural, Cheliabinsk dr., 52°39'N 59°00'E, 300 m 5 km S. Kizilskoye near Ural River, 27.V.1998 T. & K. Nupponen leg. L. Kaila prep. n. 3626 (in coll. Nupponen).

Paratypes (5 ♂ 1 ♀): 1 ♂ from the same locality and date as the holotype, J. Junnilainen leg., 2 ♂ 1 ♀ T. & K. Nupponen leg.; Cheliabinsk oblast, 53°57'N 59°03'E, 650 m, near Moskovo village 26.V.1998 2 ♂ J. Junnilainen leg., 1 ♂ T. & K. Nupponen leg.

Diagnosis. *Elachista gibbera* sp. n. also belongs to those species in the sg. *Aphelosetia* that have a broad and shallow dorsally directed me-

Fig. 19. *Elachista gibbera* sp. n., juxta, digitate process and aedeagus (holotype, L. Kaila prep. n. 3626).

dian sac in the median plate of juxta. It closest resembles the male genitalia of *E. maculosa* Parenti, described from Afghanistan. The shape of the uncus lobes however differs significantly being longer and distally tapered in *E. gibbera*, while they are widely rounded in *E. maculosa*. The mesial knob of the gnathos is also more acute-tipped in *E. gibbera* than in *E. maculosa* (cf. Parenti (1981)).

Description. Wing span 9.9–11.7 mm. Labial palpus as long as diameter of head, creamy white, slightly dusted with pale grey scales below. Head and neck tuft creamy white. Tegula and thorax creamy white, variably suffused with brownish grey scales. Scape of antenna creamy white, variably dusted with grey, flagellum dark grey, articles annulated with pale rings. Foreleg outwardly dark grey, inwardly pale, midleg pale grey, tibius suffused with grey, tarsal articles dark grey with pale distal rings, hindleg pale ochreous. Forewing ground colour creamy white, densely suffused with dark grey tipped scales that are patchily aggregated, leaving the following creamy white pattern: at basal 1/3 indistinct medially outwards angled fascia, smaller irregular patches at distal half of the wing, especially at tornus and near apex; shorter fringe scales distally dark grey forming fringe line; fringe grey except along termen creamy white. Underside dark grey; fringe grey

Fig. 20. *Elachista gibbera* sp. n. ♀ genitalia (paratype, L. Kaila prep. n. 3628).

except along termen white. Hindwing grey, fringe ochreous grey; underside as above.

Male genitalia: Uncus lobes triangular, almost twice longer than wide, tapered to narrowly rounded apex, separated by V-shaped incision. Mesial knob of gnathos basally broad, oval-shaped and distally pointed. Median plate of juxta with shallow posteriorly directed median sac; juxta lobes medially produced, median margin somewhat convex joining distal margin without an angle; distal margin with a few setae, straight; lateral margin concave. Digitate process short, setose, blunt, basally very narrow. Valva broad; basal and distal fold of costa meet at half of the length of valva, costa medially weakly convex; sacculus straight, meeting cucullus without an angle; distal margin of cucullus straight. Aedeagus half the length of valva, narrow, with short caecum; distally bent with an obtuse angle and forming swelling dorsally; distal opening simple; cornuti absent in vesica.

Female genitalia: Papillae anales broad triangular, ventrally joined by Y-shaped sclerotisation. Apophyses posteriores straight, 1.5 times longer than the nearly straight apophyses anteriores. Ostium bursae situated at posterior margin of sternum 8 which is transformed as quadrangular plate anterior to ostium bursae; width of ostium bursae 1/3 of distance between apophyses anteriores, abruptly narrowed to very short colliculum, without sclerotised reinforcements; antrum absent, ductus seminalis inception anterior to colliculum. Ductus bursae about three times longer than apophyses posteriores, membranous and without internal sclerotisations, at anterior half laterally covered with minute granules; abruptly inserted to oval-shaped corpus bursae. Signum formed as large group of coarse spines in anterior half of corpus bursae; otherwise no internal spines present.

Elachista (Aphelosetia) constitella Frey, 1859

Kidriiasovo 28.V.1998 1 ♂, 16.VI.1999 1 ♂ T. & K. Nupponen leg.; Orenburg distr. Orenburgskij Nat. Pk. 12.–17.VI.2001 1 ♂ J. Kullberg & M. Zalewski leg.; Verbljushka 30.V.–5.VI.1998 1 ♂ J. Junnilainen leg.; 20 km S. Pokrovka village, Schibendy valley 3.–7.VI.1998 1 ♂ J. Junnilainen leg.

Remarks. *E. constitella* was omitted from the checklist of European Elachistidae (Parenti 1996). The genitalia of its female lectotype were illustrated by Parenti (1977), and the male genitalia by Traugott-Olsen (1990b). *E. constitella* is at least known from Croatia, Italy and Turkey. *E. maculata* Parenti, described from Turkey: Konya (Parenti 1978) may also be referable to *E. constitella* Frey, but we are not willing to establish an uncertain new synonymy in this context. If these species prove to be synonyms, the records of *E. maculata* Parenti from Bulgaria and Greece (Parenti 1996) would also be attributable to *E. constitella* Frey. New to Russia.

Elachista (Aphelosetia) nitidulella (Herrich-Schäffer, 1855)

Arkaim 14.VI.1996 1 ♂ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg.

Distribution. Central Europe (Parenti 1996).

Remarks. New to Russia.

Elachista (Aphelosetia) manni Traugott-Olsen, 1990

Kizilskoye 27.V.1998 4 ♂ J. Junnilainen leg., 11 ♂ T. & K. Nupponen leg.; Moskovo 26.V.1998 3 ♂ J. Junnilainen leg., 4 ♂ T. & K. Nupponen leg.; Kidriiasovo 28.–29.V.1998 2 ♂ 1 ♀ J. Junnilainen leg., 1 ♂ 1 ♀ T. & K. Nupponen leg.

Distribution. Central and Eastern Europe (Parenti 1996). Traugott-Olsen (1990a) mentions it also from Russia: Volgograd.

Remarks. The identification is based on Traugott-Olsen (1990a). However, examination of the lectotype of *Elachista festucicolella* Zeller, 1853 suggests that these taxa may be synonyms. We are not, however, willing to establish an uncertain synonymy between these taxa in the present context, and therefore follow the current use of these names.

Elachista (Aphelosetia) flavesrens Parenti, 1981 (Figs. 21 and 22)

Chalk Hills 3.–7.VI.1998 2 ♂ J. Junnilainen leg., 1 ♂ T. & K. Nupponen leg., 22.VI.1999 1 ♂ T. &

K. Nupponen leg.; Volgograd distr., 80 km NW Volgograd nr. Ilovla village 2.VI.2001 2 ♂ K. Nupponen leg.

Distribution. Turkey, Armenia (Parenti 1981).

Remarks. New to Russia.

Elachista (Aphelosetia) acutella Kaila sp. n. (Figs. 23 and 24)

Holotype ♂: Russia, S. Ural, Orenburg distr., 51°23'N 56°49'E, 130–340 m, 6 km W Donskoje village, Mt. Verbljushka, 10.VI.1998 T. & K. Nupponen leg. L. Kaila prep. n. 3390 (in coll. Nupponen).

Paratypes (3 ♂): the same locality, 10.–12.VI.1998 1 ♂ J. Junnilainen leg., 2 ♂ T. & K. Nupponen leg.

Diagnosis. *Elachista acutella* sp. n. closely resembles *E. bimaculata* Parenti, *E. mus* Parenti and *E. semnani* Parenti. From these species it is readily separated by its much longer uncus lobes (cf. Parenti (1981)).

Description. Wing span 9.5–10.3 mm. Labial palpus as long as diameter of head, nearly straight, bluish white. Head, neck tuft, tegula, thorax, scape and pedicel of antenna bluish white. Foreleg inwardly dark brownish grey, outwardly pale grey, tibia and tarsal articles with bluish white distal rings; midleg pale grey; hindleg pale grey, spurs and tarsi ochreous. Forewing bluish white, basal 1/5 of costa dark grey; small brown spot in the middle of wing at fold, and another similar spot at distal 1/4 of wing; fringe concolorous with ground colour. Underside dark grey, dorsal area pale grey, fringe pale ochreous. Hindwing bluish

Fig. 25. *Elachista chamaea* sp. n. holotype ♂ (Russia: Tuva Rep. Kyzyl).

Fig. 26. *Elachista chamaea* sp. n. ♂ (Russia: Orenburg dr.).

grey, fringe scales basally ochrous grey, distally bluish white; costal area of underside dark grey, dorsal area bluish white, fringe scales basally ochreous grey, distally bluish white.

Male genitalia: Uncus lobes somewhat longer than wide, distally broadly rounded and with a few setae ventrodistally. Mesial knob of gnathos basally narrow, oval-shaped. Median plate of juxta with deep tongue-shaped dorsally directed median sac; juxta lobes medially produced, median margin straight joining distal margin with a sharp angle, distal margin nearly straight joining the straight lateral margin in an obtuse angle. Digitate process narrow, parallel-sided and blunt-tipped, about 1/4 length of valva. Valva narrow and parallel-sided, about six times longer than wide, basal and distal fold of costa joining at 2/5 length of valva. Cucullus basally slightly truncate, otherwise straight joining cucullus without limit. Vinculum U-shaped, without pointed saccus. Aedeagus narrow, 3/4 length of valva, medially slightly bent, broadest basally, tapered to a pointed apex; vesica with small blunt tooth-shaped cornutus inserted in small sclerotised plate.

leg.; Moskovo 26.V.1998 3 ♂ J. Junnilainen leg., 11.-12.VII.1998 3 ♂ 1 ♀ K. Nuppenen leg.; Kuvandyk 19.VII.1998 2 ♂ K. Nuppenen leg.; Verbljushka 30.V.-12.VI.1998 2 ♂ J. Junnilainen leg. 30.V.1998 1 ♂, 14.-16.VII.1998 5 ♂ T. & K. Nuppenen leg., 13.V.1999 1 ♂ K. Nuppenen leg.

Distribution. Transpalaearctic in steppe regions.

Elachista (Aphelosetia) chamaea Kaila sp. n. (Figs. 25-29)

Holotype ♂: Russia Tuva Rep. 51°43'N 94°27'E Kyzyl, 700m, nanophyton-steppe 5.-6.VI.1994 Jalava & Kullberg leg., L. Kaila prep. n. 1659 (in coll. ZMH); Paratypes (2 ♂): 1 ♂ with the same collection data as in the holotype, L. Kaila prep. n. 1662; Tuva Rep., Kyzyl 21.V.1990 1 ♂ V. Dubatolov leg., L. Kaila prep. n. 2208 (Coll. Zoological Museum, Novosibirsk).

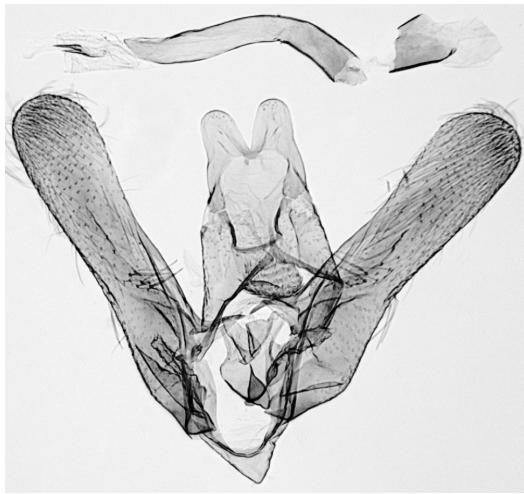

Fig. 28. *Elachista chamaea* sp. n. ♂ genitalia (Russia: Orenburg dr., L. Kaila prep. n. 3402).

Other material: Russia, S. Ural, Orenburg dr., 50°40–45'N 54°26–28'E, 170–230 m, 20 km S Pokrovka village, Schibendy Valley 11.VI.2001 1 ♂ K. Nupponen leg. L. Kaila prep. n. 3402.

Diagnosis. *Elachista chamaea* sp. n. is a close relative of *E. cornuta* Parenti, described from Iran. These species differ in the shape of aedeagus being longer in *E. chamaea* than in *E. cornuta*. The cornutus is elongate and with one or two straight teeth in *E. chamaea*, but with one short and stout, bent tooth in *E. cornuta* (cf. Parenti 1981)).

Description. Wing span 9.3–10.8 mm. Labial palpus as long as diameter of head, bluish or greyish white, variably suffused with grey below. Head, neck tuft, tegula, thorax, scape and pedicel of antenna brownish white, basal 1/4 of flagellum whitish, flagellum otherwise pale brownish grey. Fore- and midleg grey, hindleg pale grey. Forewing brownish white, basal 1/4 of costa dark grey; elongate brownish grey spot sometimes in the middle of wing at fold, and another similar spot at distal 1/4 of wing; fringe concolorous with ground colour. Underside dark grey, fringe scales ochreous. Hindwing translucent, bluish grey, fringe ochreous white; underside grey, costa somewhat darker; fringe scales ochreous.

Male genitalia: Uncus lobes slightly broader than long, distally broadly rounded and with group of setae ventrodistally. Mesial knob of gnathos broader than long, rounded. Median plate of juxta with broad tongue-shaped dorsally directed me-

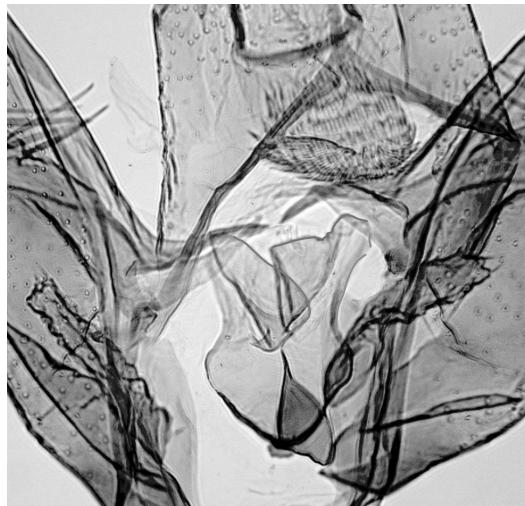

Fig. 29. *Elachista chamaea* sp. n., gnathos, juxta and digitate process (Russia: Orenburg distr., L. Kaila prep. n. 3402).

dian sac; juxta lobes laterally produced, median margin somewhat convex, joining distal margin almost without an angle; distal margin mesially almost straight, laterally somewhat truncate; lateral margin concave. Digitate process parallel-sided, blunt-tipped, 1/5 length of valva. Valva parallel-sided, about 4.5 times longer than wide, basal and distal fold of costa joining at 1/3 length of valva. Cucullus basally slightly truncate, otherwise straight joining cucullus without limit. Vinculum U-shaped, with very short and broad saccus. Aedeagus bent, parallel-sided, 6/7 length of valva, tapered to blunt apex; vesica with one straight elongate cornutus formed as one or two straight elongate teeth arising from elongate sclerotised plate, length of cornutus about 1/7 length of aedeagus.

Elachista (Aphelosetia) galacticella (Eversmann, 1844)

Verbljushka, 10.VI.1998 1 ♂ T. & K. Nupponen leg., 14.VII.1998 2 ♂, 15.VII.1998 1 ♂ K. Nupponen leg., 19.VI.1999 2 ♂ T. & K. Nupponen leg.

Distribution. Spain, Switzerland, S. Urals (Parenti 2001).

Remarks. *E. galacticella* was originally described from Orenburg district. Kaila (1999a) considered *E. deresyensis* Traugott-Olsen, from Turkey, to be a synonym of *E. galacticella*. Re-

Fig. 30. *Elachista megagnathos* Sruoga ♂ (Verbljushka).

cently collected series of specimens from Turkey apparently representing this taxon, however, indicate that *E. deresyensis* could be distinct from *E. galacticella*. Further study is needed.

***Elachista (Aphelosetia) sp. nr. dispunctella* (Duponchel, 1843)**

Russia Volgograd distr. 80 km NW Volgograd nr. Illovla village 2.VI.2001 7 ♂ K. Nupponen leg.

Remarks. Traugott-Olsen (1992) gave a taxonomic treatment for *E. dispunctella* Duponchel and its relatives. The complex was classified to consist of no less than 53 Western Palaearctic species, 44 of which he described as new. At least some of these descriptions were based on minute differences in their wing venation pattern, which later were dismissed by Albrecht and Kaila (1997). We agree with Traugott-Olsen (1992) in that many species probably are involved in this complex. However, their delimitation is in need of a thorough re-evaluation. Therefore we resign from attempting to find a name for the present specimens.

***Elachista (Elachista) gleichenella* (Fabricius, 1781)**

Miass 26.–27.VI.1997 5 ♂ 16 ♀ K. Nupponen & J. Junnilainen leg., 26.VI.1997 2 ♂ J.-P. Kaitila leg.

Distribution. Europe, Siberia (Kaila 1992), Russian Far East (Sinev & Sruoga 1997).

Fig. 31. *Elachista megagnathos* Sruoga ♀ (Verbljushka).

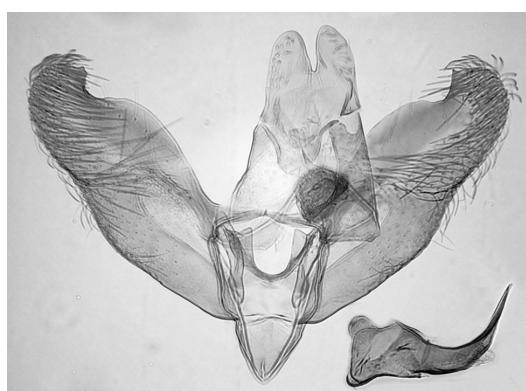

Fig. 32. *Elachista megagnathos* Sruoga ♂ genitalia (Verbljushka, L. Kaila prep. n. 3155).

Remarks. Parenti (1983) reported *E. gleichenella* from Japan. The Japanese population represents, however, a distinct species (K. Sugisima, in preparation).

***Elachista (Elachista) megagnathos* Sruoga, 1990 (Figs. 30–34)**

Verbljushka 11.VI.1998 1 ♀, 12.VI.1998 1 ♂ T. & K. Nupponen leg.

The original description of *E. megagnathos* was based on two male specimens from Russian Far East. The male of the present material agrees with the description of *E. megagnathos*, and V. Sruoga (pers. comm.) has confirmed the identification. Since the female has been unknown its description is given here.

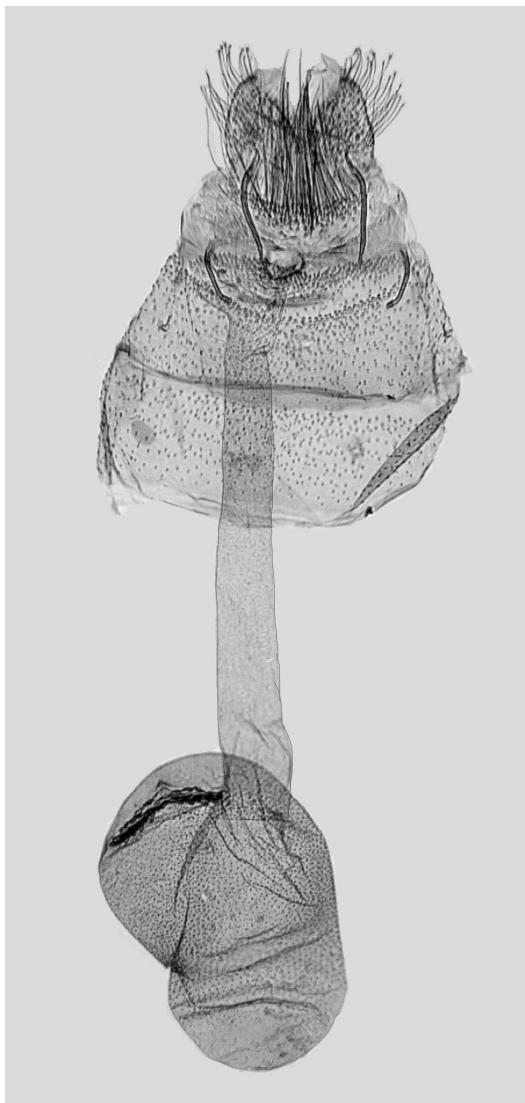

Fig. 33. *Elachista megagnathos* Sruga ♀ genitalia (Verbljushka, L. Kaila prep. n. 3318).

Description of ♀. Wing span 6.8 mm. Length of labial palpus equal to diameter of head, drooping, shiny leaden grey above, darker grey below. Head, neck tuft, thorax and scape of antenna shiny leaden grey. Flagellum dark grey, weakly annulated with somewhat paler grey rings. Legs shiny leaden grey, tibia and tarsal segments ochreous below, and annulated with pale rings. Forewing ground colour shiny blackish grey, base paler with metallic iridescence, a broad fascia before middle of wing length, and another broad fascia at distal 4/

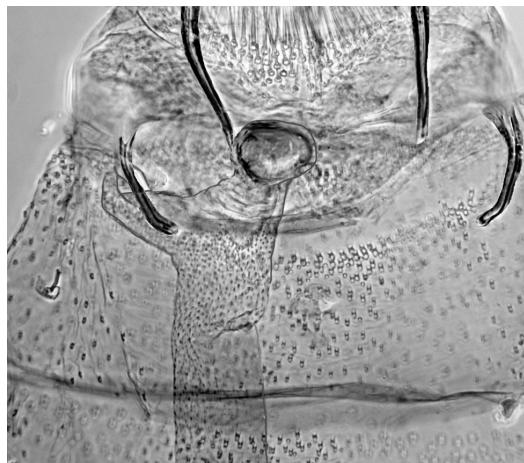

Fig. 34. *Elachista megagnathos* Sruga ♀ ostium bursae, colliculum and ductus seminalis (Verbljushka, L. Kaila prep. n. 3318).

5 of wing length of same colour. Hindwing acute-tipped, grey. Underside of wings leaden grey.

Female genitalia: Papillae anales triangular, with long distally hook-shaped setae. Apophyses posteriores stout, basally bent, apophyses anteriores stout, bent, half the length of apophyses posteriores. Membrane between papillae anales and T8 with a dense group of long setae. Ostium bursae rounded, narrowly sclerotised, situated in S8; antrum absent; colliculum shorter than apophyses anteriores, somewhat sclerotised. Ductus bursae broad, membranous, posteriorly covered with minute internal spines; without other sclerotisations, four times longer than apophyses posteriores, abruptly incited to corpus bursae. Corpus bursae reniform, covered by internal spines except distally; signum large, dentate, boomerang-shaped.

Distribution. Previously only recorded from Russian Far East (Sruoga 1990).

Remarks. New to Europe. The specimens were found at active flight during afternoon.

Elachista (Elachista) sp. nr. biatomella (Stainton, 1848) (Figs. 35 and 36)

Ajat River 4.VII.1997 1 ♂ K. Nupponen & J. Junnilainen leg.; Arkaim 9.VII.1997 1 ♂ K. Nupponen & J. Junnilainen leg., 15.VI.1999 2 ♂ T. & K. Nupponen leg.; Kidriasovo 28.-29.V.1998

Fig. 35. *Elachista* nr. *biatomella* (Stainton) ♂ (Cheliabinsk distr., Moskovo).

1 ♂ J. Junnilainen leg.; Kizilskoye 28.V.1998 1 ♂ T. & K. Nupponen leg.; Kuvandyk 19.VII.1998 2 ♂ K. Nupponen leg.; Moskovo 26.V.1998 1 ♂ J. Junnilainen leg., 3 ♂ T. & K. Nupponen leg.; Sakmara River 21.VI.1996 1 ♂ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg.; Verbljushka 29.VII.2000 1 ♀ T. Nupponen leg.

Remarks. The taxonomy of *E. biatomella* (Stainton) and its close relatives is unsettled. Traugott-Olsen (2000) recognises 11 species in this complex. With few exceptions, identification of these species is hardly possible using the literature available, including this reference. Even examination of the original type material of some of the nominal species (by LK) has not shed much light to the taxonomy. There is a lot variation in the external appearance of specimens originating from different geographic areas. However, it is less obvious when this variation can reliably be linked to characters in, e.g. the male genitalia which seem rather uniform. Since female specimens belonging to this species complex are rare in collections, the range of variation in their morphology within and between populations is insufficiently scrutinised. The nominal taxa with subtle if any morphological differences between each other are *E. biatomella* (Stainton, 1848), *E. christensi* Traugott-Olsen, 2000, *E. falirakiensis* Traugott-Olsen, 2000, *E. nevadella* Traugott-Olsen, 2000, *E. boursini* Amsel, 1951, *E. glaserella* Traugott-Olsen, 2000 and *E. kleini* Amsel, 1935. Two further species, *E. jordanella* Amsel, 1935 and *E. zabella* Chrétien, 1908 are only known from female specimens.

Externally, the specimens from southern Urals are smaller and darker than "typical" *E. biatomella*

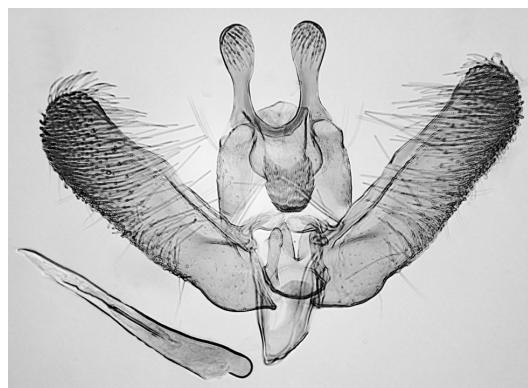

Fig. 36. *Elachista* nr. *biatomella* (Stainton) ♂ genitalia (Cheliabinsk distr., Moskovo, L. Kaila prep. n. 3131).

specimens from western Europe (Fig. 35). The dark forewing colour seems different from any named species in this complex as shown by Traugott-Olsen (2000). In the absence of any obvious constant differences in the male genitalia of these specimens (Fig. 36) compared to the species listed above we are not willing to introduce any further names in this complex. At present, identification of the Uralese specimens is not possible to the species level.

Elachista (Elachista) tetragonella (Herrich-Schäffer, 1855)

Miass 28.VI.1997 1 ♀ K. Nupponen & J. Junnilainen leg.

Distribution. Europe.

Remarks. New to Russia.

Elachista (Elachista) martinii Hofmann, 1898

Miass 26.–27.VI.1996 19 ♂ 6 ♀ K. Nupponen & J. Junnilainen leg., 13.VI.1996 11 ♂ 2 ♀ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg., 19.–20.VI.1998 2 ♂ T. & K. Nupponen leg., 29.V.2001 3 ♂, 19.VI.2001 1 ♂ K. Nupponen leg. (4 ♂ 1 ♀ in ZMH).

Distribution. Europe, S. Siberia (unpublished specimen from Russia: Altai, Katun valley nr. Katanda 22.VII.1983 Exp. Mikkola, Hippa & Jalava leg. (ZMH)).

Remarks. New to Russia.

Distribution. Holarctic (Kaila 1996), (Sugisima 1999).

***Elachista (Elachista) contaminatella* Zeller, 1847**

Biselachista spinigera Sruga, 1990

Berlin 1.VII.1997 2 ♂ 1 ♀ K. Nupponen & J. Junnilainen leg.; Arkaim 17.–19.VI.1996 2 ♂ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg.; Novoletzk 9.VI.1998 1 ♂ T. & K. Nupponen leg.; Orenburg distr. Orenburgskij Nat. Pk. 12.–17.VI.2001 3 ♂ J. Kullberg & M. Zalewski leg.

Distribution. Canary Islands (Klimesch 1990), S. Europe (Parenti 1996), Turkmenistan (Sruga 1990, as *Biselachista spinigera*).

Remarks. New to Russia.

***Elachista (Elachista) utonella* Frey, 1856**

Verbljushka 14.VII.1998 1 ♂ K. Nupponen leg.; Kuvandyk 20.VII.1998 1 ♀ K. Nupponen leg.; Ajat River 4.VII.1997 1 ♀ K. Nupponen & J. Junnilainen leg.; Arkaim 9.VII.1997 1 ♂ K. Nupponen & J. Junnilainen leg.; Berlin 30.VI.–1.VII.1997 1 ♂ 1 ♀ K. Nupponen & J. Junnilainen leg.

Distribution. Transpalaearctic (Sugisima 1999).

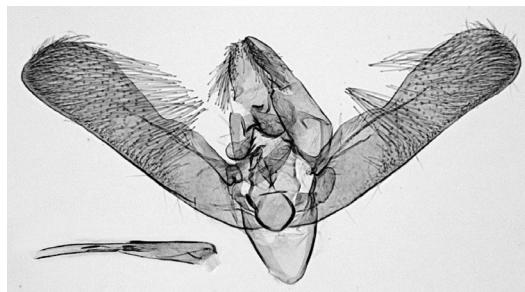

Fig. 38. *Elachista devexella* sp. n. ♂ genitalia (holotype, L. Kaila prep. n. 3143).

***Elachista (Elachista) devexella* Kaila sp. n. (Figs. 37–40)**

Holotype ♂: Russia, S. Ural, Orenburg distr. 50°40–45'N 54°26–28'E, 170–230 m, 20 km S. Pokrovka village, Schibendy valley 7.VI.1998 T. & K. Nupponen leg., L. Kaila prep. n. 3143 (in coll. Nupponen).

Diagnosis. *Elachista devexella* belongs to the *E. tetragonella* group as delimited by Kaila (1999a). Its bilobed mesial knob of gnathos and the very short uncus lobes indicate a close relationship with *E. trapeziella* Stainton, *E. kebneella* Traugott-Olsen & Nielsen, *E. cinereopunctella* (Haworth) and *E. imatrella* Schantz. From all these species it is readily separated by the peculiar shape of the valva with an expanded and distally oblique cucullus.

Description. Wing span 7.3 mm. Length of labial palpus equal to diameter of head, ochreous grey above, mottled by darker grey scales below. Head, neck tuft, scape of antenna, tegula and thorax ochreous grey, tip of tegula and mesothorax paler grey. Flagellum of antenna grey. Foreleg leaden grey, mid- and hindleg paler. Forewing ground colour grey, mottled with brownish tips of scales; in the middle of wing at fold small somewhat darker brown spot which is inwardly and outwardly narrowly bound by white. Fringe scales concolorous with ground colour. Hindwing and underside of both wings grey with concolorous fringe scales.

Male genitalia: Uncus lobes very short, broad and rounded, mesially hardly separated from each other, ventrally densely covered by thick scales. Mesial knob of gnathos divided into two elongate lobes. Median plate of juxta rounded, concave. Juxta lobes laterally somewhat produced, a little

Fig. 39. *Elachista devexella* sp. n. gnathos, juxta and digitate process (holotype, L. Kaila prep. n. 3143).

longer than wide, median margin slightly truncate joining distal margin at an obtuse angle, distal margin almost straight, with a few setae, lateral margin straight. Digitate process medially angled, club-shaped, 1/5 length of valva. Basal and distal fold of costa of valva meet at 1/4 length of valva, costa somewhat convex; sacculus straight joining cucullus without an angle. Cucullus expanded, size half of the total of valva, distally somewhat oblique. Vinculum large, rounded, without saccus. Aedeagus straight, 2/3 length of valva, basally broadest, with minute caecum, vesica with weakly sclerotised cylindrical cornutus, length of which about 1/6 length of aedeagus.

Elachista (Elachista) alpinella Stainton, 1854

Iremel, 1300–1500 m, 11.VII.1997 1 ♂ K. Nupponen & J. Junnilainen leg.

Distribution. Holarctic (Kaila 1999b).

Elachista (Elachista) sp. nr. kilmunella

Russia, S. Ural, Cheliabinsk distr. 52°39'N 59°34'E, 350 m, Arkaim res. nr. Amurskii vill. 14.VI.1996 1 ♂ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg.

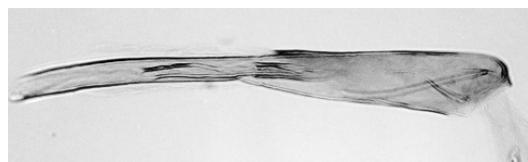

Fig. 40. *Elachista devexella* sp. n. aedeagus (holotype, L. Kaila prep. n. 3143).

Remarks. The single specimen was collected from steppe. Its genitalia differ from the *Eriophorum* feeding *E. kilmunella* Stainton by the broad valva and stout cornuti. It may represent an undescribed species, but the material available is too limited for a safe identification.

Elachista (Elachista) albifrontella (Hübner, 1817)

Suleimanovo 14.VI.2001 1 ♂ K. Nupponen leg.; Miass 26.VI.1997 1 ♂ K. Nupponen & J. Junnilainen leg.

Distribution. Europe, Siberia (Kaila 1992).

Elachista (Elachista) apicipunctella Stainton, 1849

Iremel, 900–1300 m, 23.VI.1996 2 ♂ K. Nupponen, J.-P. Kaitila, J. Junnilainen & M. Ahola leg.

Distribution. Europe.

Elachista (Elachista) sp.

Russia, S. Ural, Cheliabinsk distr. 55°01'N 60°06'E, 350 m, Miass, Ilmen State Res. 26.VI.1997 1 ♂ K. Nupponen & J. Junnilainen leg.

Remarks. The species, represented by a single specimen only, is a member of the notoriously difficult *Elachista bifasciella* group. It is not attributable to any species known to us, but the material available does not enable us to judge its status further.

Elachista (Elachista) diederichsiella Hering, 1889

Iremel, 900–1300 m, 25.–26.VI.1996 2 ♂ K. Nupponen, K.-P. Kaitila, J. Junnilainen & M. Ahola leg.

Distribution. Europe, Siberia (Kaila 1992).
