

A new species of *Mongolotettix* Rehn, 1928 from Henan, China (Orthoptera: Acridoidea, Acrididae)

Xiang-Chu Yin, Li-Li Ji & Li Dai

Yin, X. C., Ji, L. L. & Dai, L. 2017: A new species of *Mongolotettix* Rehn, 1928 from Henan, China (Orthoptera: Acridoidea, Acrididae). — *Entomol. Fennica* 28: 103–106.

A new species of the genus *Mongolotettix* Rehn, 1928 from Henan, China is described. The new species, *Mongolotettix tongbaishanensis* Yin, Ji et Dai sp. n. is similar to *M. shanxiensis* Shi, Liu et Li, 2016, but differs from the latter by shorter tegmina of male, which reach the hind margin of the 6th abdominal tergite, the maximum width of cubital area being 1.2 times wider than the maximum width of the medial area, the prozona of male being 1.5 times longer than the metazona, the tegmina of female being short, extending slightly over the hind margin of the 1st abdominal tergite, the length of tegmina being 2.5 times longer than its maximum width, the epiphallus being wider than high, and the length of the upper ovipositor valve being 4.4 times longer than its maximum width.

1. Introduction

The grasshopper genus *Mongolotettix* Rehn, 1928 contains 9 species that are distributed in Far Eastern Asian countries of China, Japan, Korea, Mongolia, and Russia (Bolívar 1898, Uvarov 1914, Caudell 1921, Bei-Bienko & Mishchenko 1951, Chogsomzhav 1974, Li & Lian 1994, Yin *et al.* 1996, Wan *et al.* 1998, Xie & Li 2000, Yin, Xia *et al.* 2003, Yin, Zhang *et al.* 2003, Yin *et al.* 2004, Kim & Kim 2005, Huang *et al.* 2010, Eades *et al.* 2016, Shi *et al.* 2016). In the present paper, we describe a new species of the genus from China.

2. Materials and methods

Descriptions and measurements were made under a stereomicroscope (Leica M 205 A, LAS V 4.0). The figures were drawn with a Canon 5D Mark II and Adobe Photoshop version 9.0 software.

Both specimens studied are deposited in the Shanghai Entomological Museum (SEM), Chinese Academy of Sciences, Shanghai, 200032, China.

Table 1. Comparison of *Mongolotettix tongbaishanensis* Yin, Ji et Dai sp. n. and *M. shanxiensis* Shi, Liu et Li, 2016.

Character	<i>M. tongbaishanensis</i>	<i>M. shanxiensis</i>
Tegmina of male	Short, reaching hind margin of 6 th abdominal tergite, maximum width of cubital area 1.2 times maximum width of medial area	Long, reaching end of epiproct, maximum width of cubital area 2.6 times maximum width of medial area
Pronotum of male	Prozona 1.5 times longer than metazona	Prozona 1.3 times longer than metazona
Tegmina of female	Short, extending slightly over hind margin of 1 st abdominal tergite, length 2.5 times maximum width	Long, reaching middle of 2 nd abdominal tergite, 3.8 times longer than maximum width
Epiphallus	Wider than high	Width equal to height
Upper ovipositor valve	Length 4.4 times maximum width	Length 3.8 times maximum width

3. Description of *Mongolotettix tongbaishanensis* Yin, Ji et Dai sp. n. (Fig. 1, Table 1)

Type material. Holotype ♂: China, Henan, Tongbaishan 31°52'N, 113°57'E, 13.VII.1984, Zhang Xiu-Jiang leg. (SEM); Paratype ♀: same locality as holotype, 1.VIII.1984, Wang Huang leg. (SEM). Collected from forest grassland by insect net.

Diagnosis. The new species is similar to *M. shanxiensis* Shi, Liu et Li, 2016. The major differences are listed in Table 1.

Description. Male. Body small (Fig. 1a).

Head. Shorter than pronotum; face oblique in profile; frontal ridge gradually widened toward clypeus (Fig. 1b); antennae 20-segmented, extending distinctly over hind margin of pronotum; eyes oval, vertical diameter of eye 1.4 times longer than horizontal diameter and 1.4 times longer than subocular groove.

Thorax. Pronotum cylindrical, lateral and median keel distinct; frontal margin of disc slightly rounded, caudal margin triangular; median keel cut by typical transversal sulcus behind middle of median keel; lateral keels almost parallel, prozona 1.5 times longer than metazona. Tegmina long, reaching hind margin of 6th abdominal tergite, apically concave in middle, maximum width of cubital area 1.2 times maximum width of medial area (Fig. 1e). Space narrow between meso-

thoracic lobes, internal margin of mesothoracic lobes concave, narrowed in middle (Fig. 1c). Hind femur 5.7 times as long as its maximum width, stridulatory margin of femur with 99 stridulatory pegs; hind tibia with 12 spines in both sides, external apical spine absent. Second metatarsomere shorter than first.

Abdomen. Tympanum on both sides of first abdominal tergite, its width nearly equal to height in middle. Furculae lacking. Cercus conical, long, almost reaching tip of anal tergum, 3.0 times as long as wide at base. Subgenital plate long, acute-shaped in lateral view and triangular from above (Fig. 1f). Width of epiphallus wider than high (Fig. 1d).

Female. Body more robust than in male (Fig. 1g). Antennae ensiform, 18 segmented (Fig. 1j). Vertical diameter of eye 1.7 times longer than horizontal diameter and 1.1 times longer than subocular groove; prozona 1.6 times longer than metazona (Fig. 1h); space between mesothoracic lobes slightly narrow (Fig. 1i); tegmina short, extending slightly over hind margin of 1st abdominal tergite, length 2.5 times as long as wide. Hind femur 4.8 times longer than maximum width. Cercus short, conical, not reaching end of subgenital plate; subgenital plate long, length 2.5 times width (Fig. 1k); upper ovipositor valve long, length 4.4 times maximum width, with small teeth on outer margin.

Colouration. Body brown. Antennae yellow. Pronotum yellowish-brown. Tegmina without a

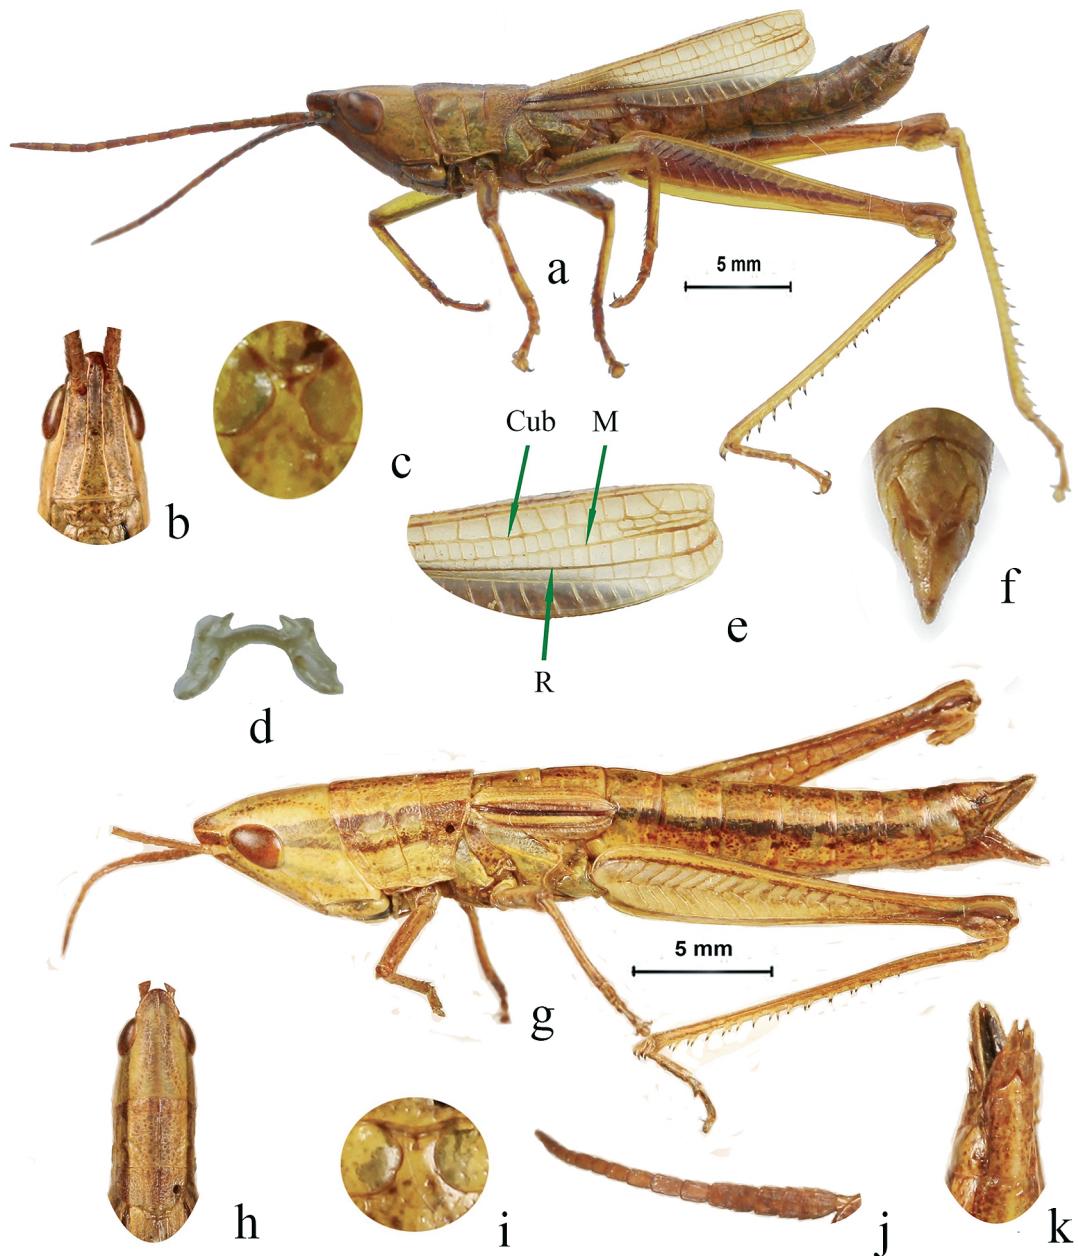

Fig. 1. *Mongolotettix tongbaishanensis* Yin, Ji et Dai sp. n. – a. Body, ♂, lateral view. – b. Head, ♂, front view. – c. Mesosternum, ♂. – d. Epiphallus, ♂. – e. Tegmen, ♂. – f. End of abdomen, ♂, dorsal view. – g. Body, ♀, lateral view. – h. Head and pronotum, ♀, dorsal view. – i. Mesosternum, ♀. – j. Antenna, ♀. – k. End of abdomen, ♀, ventral view.

white stripe at base of fore margin in male and with a black longitudinal stripe in middle in female. Abdomen yellowish-brown, with a broad dark longitudinal stripe on both sides. Subgenital plate brown.

Measurements (lengths in mm). Body: ♂

20.3, ♀ 29.7. Tegmina: ♂ 11.4, ♀ 4.4. Hind femur: ♂ 13.0, ♀ 15.4.

Etymology. The description is based on specimens collected from Tongbaishan (Henan, China), which is the type locality of the new species.

Acknowledgements. This study was funded by the National Natural Science Foundation of China (No. 3137153) and Scientific Research Projects of Hebei Higher Institutions for High-level Personnel (No. GCC2014001). We are grateful to Mr. Zhang Xiu-Jiang and Mr. Wang Huang for collecting the type specimens.
