

New *Mycomya* species from South Korea (Diptera: Mycetophilidae)

Rauno Väisänen

Väisänen, R. 2013: New *Mycomya* species from South Korea (Diptera: Mycetophilidae). — *Entomol. Fennica* 24: 165–171.

The material of the genus *Mycomya* Rondani from South Korea is revised. The following three new species are described: *M. yamagishii* sp. n., *M. mogera* sp. n., and *M. sudosanensis* sp. n. *Mycomya winnertzi* (Dziedzicki), *M. dziedzickii* Väisänen, *M. occultans* (Winnertz), *M. wuorentausi* Väisänen, and *M. paradentata* Väisänen are recorded as new to the South Korean fauna. A key is given to the South Korean species.

R. Väisänen, Metsähallitus Natural Heritage Services, P. O. Box 94, FI-01301, Vantaa, Finland; E-mail: rauno.vaisanen@metsa.fi

Received 1 June 2012, accepted 22 November 2012

1. Introduction

The taxonomy of the mycetophilid genus *Mycomya* Rondani, 1856 is relatively well-known in the western Palaearctic region (Väisänen 1984a), but during the last three decades increasing information has become available also from the eastern Palaeoctic region. Several *Mycomya* species have been recorded and described from China (e.g. Wu & Yang 1990, 1992, 1994a, b, 1995a, b, 1996, Wu 1995, 1998, Wu *et al.* 2001) and eastern Russia (Väisänen 1984a, Zaitzev 1994, Krzeminska & Klimont 2011). There are also scattered records of *Mycomya* species from other areas in eastern and southeastern Asia (e.g. Edwards 1935, Shinji 1939, Okada 1940, Sasakawa 1961, 2003, 2005, Colless & Liepa 1973, Laštovka & Matile 1974, Väisänen 1984a, b, 1996).

This paper is the first contribution to the *Mycomya* species of the Korean peninsula. Three new species from South Korea are described below, and five other species are recorded as new to the South Korean fauna. Keys to the subgenera

and the Holarctic species were provided by Väisänen (1984a). A key is given here to the South Korean species. *Mycomya* species are usually readily recognizable on the basis of the male hypopygium (terminalia), while external characters are relatively unreliable as diagnostic characters.

2. Material and methods

The study material comes from the Kyushu University Collections, Biosystematics Laboratory, Ropponmatsu, Fukuoka, Japan (KUC). The material was collected on Mount Sudo-san in the south-eastern part of South Korea.

The methodology and morphological terminology in the main follows that of Väisänen (1984a, 1996). Leg ratios refer to the length ratio of each basitarsus and the respective tibia. The wing vein ratios (M and Cu ratios) were calculated as follows: first, the length ratio of the petiole to the anterior branch (M1 or Cu1) and second, the length ratio of the petiole to the posterior branch (M2 or Cu2).

3. Key to South Korean *Mycomya* species

1. Coxa 2 with a spur 2
 - Coxa 2 without a spur
 - 6 (Subgenus *Mycomyopsis*)
2. Abdominal tergites entirely dark or light, or dark with paler posterior margins; abdominal tergite 8 with setae; tergite 9 without a fork-like median structure; ocellar prominence not distinctly darker than posterior parts of head; spur of coxa 2 long, more than half of the length of coxa 3 (Subgenus *Mycomyap.p.*)
 - Abdominal tergites yellow with dark posterior margins; abdominal tergite 8 bare; tergite 9 with a fork-like median structure; ocellar prominence usually distinctly darker than posterior parts of head; spur of coxa 2 short, less than half of the length of coxa
 - 5 (Subgenus *Calomycomya*)
3. Processus of tergite 9 short, wide, apically more or less bilobed 4
 - Processus of tergite 9 long, slender, not bilobed *M. occultans* (Winnertz)
4. Processus apically only slightly bilobed; inner margin of tergal lateral appendage densely covered with short setae
 - M. winnertzi* (Dziedzicki)
 - Processus deeply bilobed; tergal lateral appendage with some scattered

M. dziedzickii Väisänen
5. Tergal fork of tergite 9 basally Y-shaped; gonostylus with a long, slender branch and a short, slender, curved branch
 - M. yamagishii* sp. n.
 - Tergal fork of tergite 9 basally V-shaped; gonostylus with a long, wide, apically curved branch and a short, slender, curved branch

M. wuorentausi Väisänen
6. Sternal submedian filament missing
 - M. mogera* sp. n.
 - Sternal submedian filament present 7
7. Tergal lateral appendage of tergite 9 wide with a very wide comb-like brush of flattened, apical-subapical setae covering almost half of its inner margin; base of tergite 9 without a basal extension; gonostylus with 2 teeth
 - M. paradentata* Väisänen
 - Tergal lateral appendage slender with dense

group of flattened, curved apical setae; base of tergite 9 with a long curved lateral extension; gonostylus with 5–6 teeth

M. sudosanensis n. sp.

4. The species

4.1. Subgenus *Mycomya* s. str.

4.1.1. *Mycomya winnertzi* (Dziedzicki, 1885)

Material examined. 1 male: South Korea, Gyongsangbug-Do, Mt. Sudo-san, 800 m, 5.VIII.1977, K. Yamagishi leg. (in KUC).

Distribution. The South Korean specimen belongs to the nominal subspecies, not to *M. winnertzi schmidi* Väisänen, 1984 known from the Himalayas (Väisänen 1984a, 1996). Widely distributed in the Holarctic region (Väisänen 1984a), new to the South Korean fauna. Reported from Japan (Shinji 1939, Okada 1940). For its biology, see Väisänen (1984a).

4.1.2. *Mycomya dziedzickii* Väisänen, 1981

Material examined. 1 male: South Korea, Gyongsangbug-Do, Mt. Sudo-san, 800 m, 5.VIII.1977, K. Yamagishi leg. (in KUC).

Distribution. Previously known only from Western Palaearctic region (Väisänen 1984a, Zaitzev 1994). For its biology, see Väisänen (1984a).

4.1.3. *Mycomya occultans* (Winnertz, 1863)

Material examined. 1 male: South Korea, Gyongsangbug-Do, Mt. Sudo-san, 1,000 m, 1.VIII. 1977, K. Yamagishi leg. (in KUC); 1 male, same data, 800 m, 5.VIII.1977 (in KUC).

Distribution. Widely distributed in the Palaearctic region (Väisänen 1984a). Recorded from the Kuril Islands (Väisänen 1984a), Japan (Sasaki 1961, Väisänen 1984b), China (Shanxi, Zhejiang, Guizhou) (Wu & Yang 1994a, Wu 1995), India (Uttar Pradesh) and Myanmar (Väisänen 1996). For its biology, see Väisänen (1984a) and Jakovlev (2011).

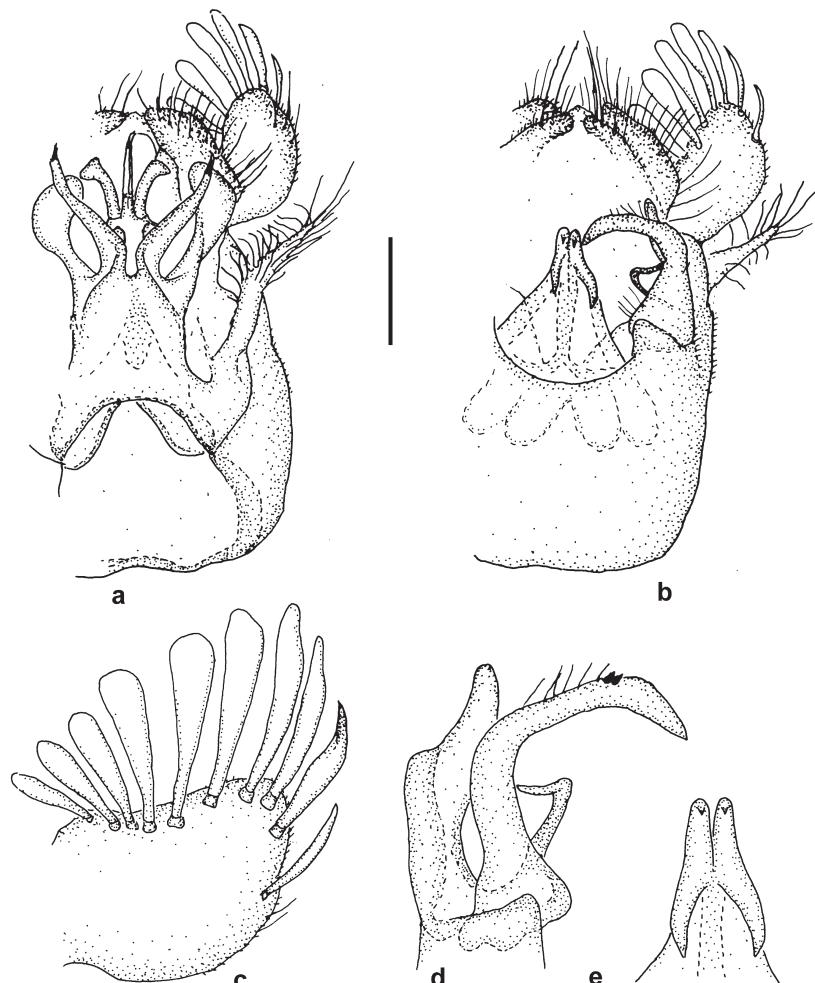

Fig. 1. *Mycomya yamagishii* sp. n., male hyopygium. – a–b. Tergal and sternal views. – c. Apex of sternal lateral appendage, twice enlarged. – d. Gonostylus, twice enlarged. – e. Apex of aedeagus, lateral view, twice enlarged. Scale bar 0.2 mm.

4.2. Subgenus *Calomycomya* Väisänen, 1984

4.2.1. *Mycomya yamagishii* sp. n. (Fig. 1)

Type material. Holotype male: South Korea, Gyongsangbug-Do, Mt. Sudo-san, 500 m, 8.VI. 1977, K. Yamagishi leg. (in KUC).

Description. Male.

Head. Palp, other mouthparts and face yellow, posterior parts of head yellowish, ocellar prominence brown. Antenna brownish, scape, pedicel and base of 1st flagellomere yellow. 1st flagellomere about 3×, 2nd 1.5× as long as wide.

Thorax. Pronotum yellow, with 5 longer setae. Mesoscutum yellow with 3 brownish undistinct longitudinal stripes. Mesanepisternum and mesokatepisternum yellow. Scutellum yel-

lowish, with 4 long setae. Laterotergite yellow. Mediotergite yellowish, bare.

Wing. Length 4.2 mm. Hyaline, apex very weakly infuscated. Sc ending in C distally to middle of small cell, Sc2 ending in R1 distally to middle of small cell. Apical part of Sc bearing 20 macrotrichia. Small cell about twice as long as wide. Cu fork below M fork. M ratios: 0.45, 0.60. Cu ratios: 0.77, 1.15. Macrotrichia: M petiole: 0; M1: +; M2: +; Cu petiole: +; Cu1: +; Cu2: +. Halter pale yellowish.

Legs. Coxae and femora yellow, tibiae and tarsi brownish to brown. Coxa 1 with some thin setae along anteromedial surface. Coxa 2 with short curved spur with 1 apical teeth. Leg ratios: bt1:t1 = ?, bt2:t2 = ?, bt3:t3 = ?

Abdomen. Tergites 1–5 yellow, with brown

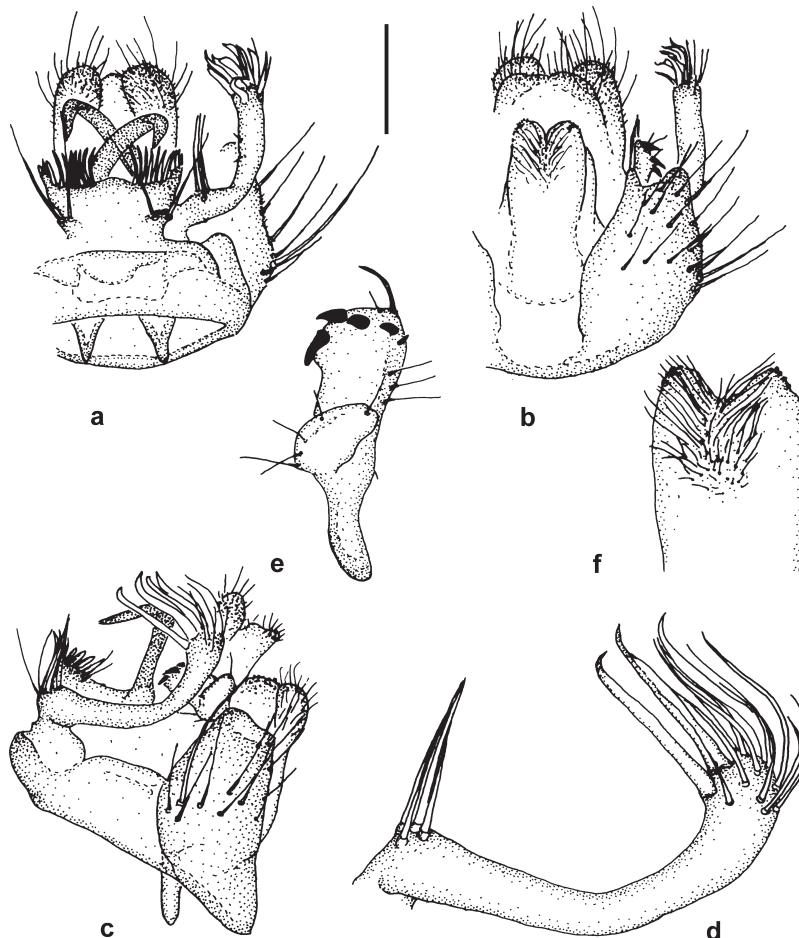

Fig. 2. *Mycomya mogera* sp. n., male hypopygium. – a–c. Tergal, sternal and lateral views. – d. Tergal lateral appendage, twice enlarged. – e. Gonostylus, twice enlarged. – f. Apex of aedeagus, sternal view, twice enlarged. Scale bar 0.2 mm.

medial line and posterior margins, 6–7 brownish to brown. Sternites 1–5 yellow, 6–7 brownish.

Hypopygium (Fig. 1). Yellowish. Tergal fork Y-shaped, deeply bilobed, with short apical setae and rounded lateral lobes. Sternal lateral appendage with many flattened setae (Fig. 1c). Gonostylus with two branches, one long and curved with two subapical teeth, and another short, slender and curved (Fig. 1d). Aedeagus with 2 long spurs (Fig. 1e).

Female. Unknown.

Distribution. South Korea.

Etymology. The species is named after the Japanese entomologist K. Yamagishi, who collected the holotype.

Remarks. Differs from the other species of the subgenus *Calomycomya* (see Väisänen 1984a, and *M. lintanana* in Wu & Yang 1994b) in the de-

tails of the male hypopygium, e.g. the characteristic shapes of the tergal fork and the gonostylus.

4.2.2. *Mycomya wuorentausi* Väisänen, 1984

Material examined. 2 males: South Korea, Gyongsangbug-Do, Mt. Sudo-san, 1,000 m, 1.VIII.1977, K. Yamagishi leg. (in KUC).

Distribution: Described from Vladivostok, Russian Far East (Väisänen 1984a). Recorded also from Zhejiang and Fujian in China (Wu & Yang 1994a) and Japan (Sasakawa 2005).

4.3. Subgenus *Mycomyopsis* Väisänen, 1984

4.3.1. *Mycomya mogera* sp. n. (Fig. 2)

Type material. Holotype male: South Korea,

Gyongsangbug-Do, Mt. Sudo-san, 1,000 m, 1.VIII.1977, K. Yamagishi leg. (in KUC). Paratypes: same data, 31 males (in KUC).

Description. Male.

Head. Palp, other mouthparts and face yellow, posterior parts of head brownish to brown. Antenna brownish, scape, pedicel and base of 1st flagellomere yellow. 1st flagellomere about 4×, 2nd 2.5× as long as wide.

Thorax. Pronotum yellow, with 3–4 longer setae. Mesoscutum yellow with 3 brown fused longitudinal stripes. Mesanepisternum and mesokatepisternum yellow. Scutellum yellow, with 4 long setae. Laterotergite yellow. Mediotergite yellowish, bare.

Wing. Length 3.5–4.0 mm. Hyaline. Sc ending in R1 slightly distally or proximally to middle of small cell, Sc1 missing. Apical part of Sc bearing 1–11 macrotrichia. Small cell about 1.5 times as long as wide. Cu fork distinctly distal to M fork. M ratios: 0.96–1.05, 1.38–1.44. Cu ratios: 0.96–1.04, 1.56–1.60. Macrotrichia: M petiole: 0; M1: 0; M2: 0; Cu petiole: 0; Cu1: 0; Cu2: 0. Halter pale yellowish.

Legs. Coxae and femora yellow, tibiae and tarsi brownish to brown. Coxa 1 without special setae. Coxa 2 without spur. Leg ratios: bt1:t1 = 0.83–0.88, bt2:t2 = 0.71, bt3:t3 = 0.58–0.61.

Abdomen. Tergites brownish, sternites yellowish.

Hypopygium (Fig. 2). Yellow. Tergite 9 with two pairs of combs, outer combs clearly separated from each other, both with 6–7 spines. Tergal lateral appendage long, slender and slightly curved, with pale curved apical setae, middle part bare, and a spine-like group of basal setae (Fig. 2d). Sternal submedian filament missing. Gonostylus with 4–5 small subapical teeth and a long seta (Fig. 2e). Apex of aedeagus wide, setose (Fig. 2f).

Female. Unknown.

Distribution. South Korea.

Etymology. The species name is an arbitrary combination of letters.

Remarks. Differs from the other species of the subgenus *Mycomyopsis* in the details of the male hypopygium, e.g. the shape and setosity of tergal lateral appendage and the lack of sternal submedian filaments. Chinese *M. elegantula*, Wu & Yang, 1992, differs from *M. mogera* sp. n. in having short sternal submedian appendage and

tergal lateral appendages without flattened apical setae.

4.3.2. *Mycomya paradentata* Väisänen, 1984

Material examined. 2 males: South Korea, Gyongsangbug-Do, Mt. Sudo-san, 1,000 m, 1.VIII.1977, K. Yamagishi leg., (in KUC).

Distribution. Previously known only from Western Palearctic region: France, Poland, Denmark, Sweden, Finland, Russia (near St. Petersburg) and Ukraine.

4.3.3. *Mycomya sudosanensis* sp. n. (Fig. 3)

Type material. Holotype male: South Korea, Gyonsangbug-Do, Mt. Sudo-san, 1,000 m, 1.VIII.1977, K. Yamagishi leg. (in KUC). Paratypes: same data, 14 males (in KUC).

Description. Male.

Head. Palp and other mouthparts yellow, face yellowish, posterior parts of head brown. Antenna brownish, scape, pedicel and base of 1st flagellomere lighter. 1st flagellomere about 4×, 2nd 2× as long as wide.

Thorax. Pronotum yellow, with 3 longer setae. Mesoscutum brownish to brown, anterior margin widely yellow. Mesanepisternum and mesokatepisternum yellow. Scutellum yellow, with 4 long setae. Laterotergite yellowish to brownish. Mediotergite yellowish, posterior part brownish, bare.

Wing. Length 2.9–3.3 mm. Hyaline. Sc ending in R1 slightly distally or proximally to middle of small cell, Sc1 missing. Apical part of Sc bearing 6–13 macrotrichia. Small cell 1–1.5 times as long as wide. Cu fork distinctly distal to M fork. M ratios: 1.04–1.19, 1.36–1.60. Cu ratios: 1.00–1.05, 1.67–1.70. Macrotrichia: M petiole: 0; M1: 0; M2: 0; Cu petiole: 0; Cu1: 0; Cu2: 0. Halter pale yellowish.

Legs. Coxae and femora yellow, tibiae and tarsi brownish to brown. Coxa 1 without special setae. Coxa 2 without spur. Leg ratios: bt1:t1 = 0.69–0.79, bt2:t2 = 0.57–0.60, bt3:t3 = 0.56–0.57.

Abdomen. Brownish.

Hypopygium (Fig. 3). Yellow. Tergite 9 with two pairs of combs, outer combs wide, both with about dozen spines, base of the comb with long,

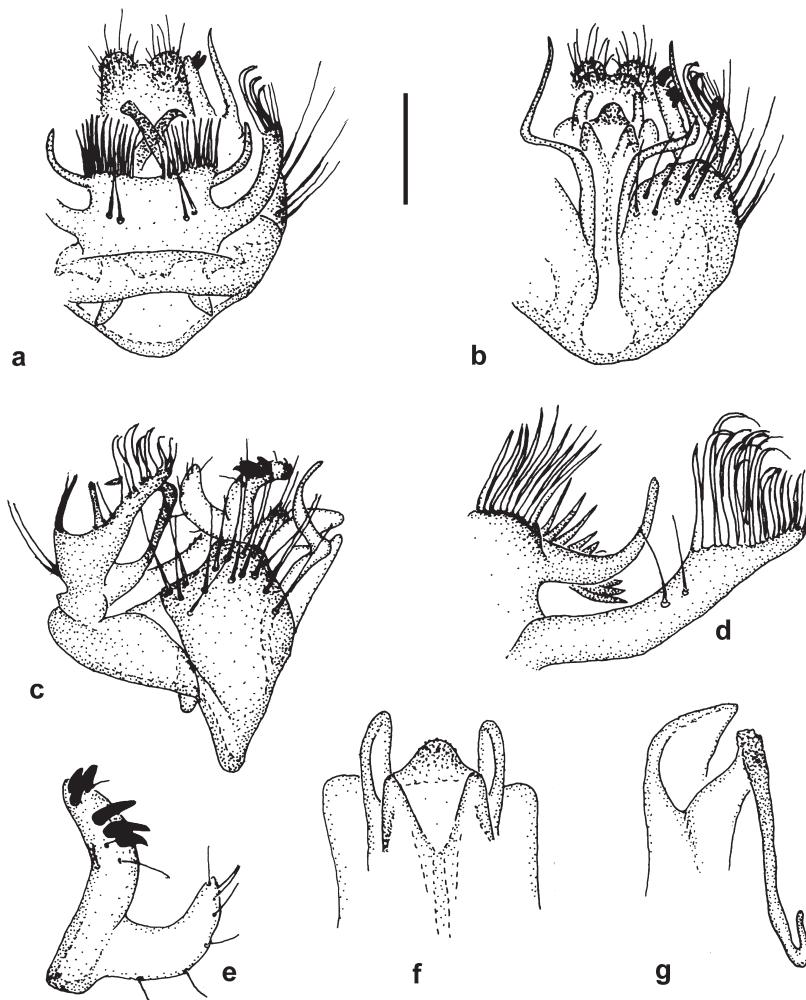

Fig. 3. *Mycomya sudosanensis* sp. n., male hypopygium. — a–c. Tergal, sternal and lateral views. — d. Tergal lateral appendage and tergal combs, with curved lateral extension at base of outer comb. — e. Gonostylus, twice enlarged. — f–g. Apex of aedeagus, sternal and lateral views, twice enlarged. Scale bar 0.2 mm.

curved lateral extension (Fig. 3a,d). Tergal lateral appendage long, slender, slightly curved, mostly bare with a dense group of flattened curved apical setae (Fig. 3d). Sternal submedian filament long, curved. Gonostylus with 5–6 subapical teeth (Fig. 3e). Apex of aedeagus wide with lobes and poorly visible long curved spurs (Fig. 3f–g).

Female. Unknown.

Distribution. South Korea.

Etymology. The species is named after its type locality.

Remarks. Differs from the other species of the subgenus *Mycomyopsis* in the details of male hypopygium, e.g. in the shape and setosity of tergal lateral appendage and in having the characteristic long, curved lateral extensions of the base of the outer tergal combs. Nearctic *M. dentata* (Fisher,

1937) has similar lateral extensions of the base of the outer tergal combs, but it differs from *M. sudosanensis* sp. n. in the shape and setosity of the tergal lateral appendage and gonostylus having 3 teeth.

Acknowledgements. I wish to thank Prof. Toyohei Saigusa and Prof. Hiroshi Shima (Ropponmatsu, Japan), for placing their material at my disposal. I am very grateful to Prof. Kari Heliövaara (University of Helsinki), Dr. Pekka Vilkamaa (Zoological Museum, University of Helsinki) and Jevgeni Jakovlev (Finnish Environment Institute, Helsinki) for technical assistance.
